Karm Darshan — Chapter 3, Complete (Working English Translation)

*Machine-assisted working translation of the whole of chapter 3 (printed pp. 53-153) of Manav Karm Darshan (v5) by Shri A. Nagaraj, combined here from 7 batch files for review. **Not a published translation** — verify against the Hindi original (`../KD-karm darshan v5.pdf`) before quoting. See `README.md` and `TRANSLATION-PLAN.md` in this folder for the per-batch breakdown, and `KD-Glossary-Additions.md` for terminology decisions.*

Karm Darshan — Chapters 3.1–3.3 (Working English Translation)

Machine-assisted working translation from Manav Karm Darshan (v5), translated from page images (printed pp. 53–62). Not a published translation — verify against the Hindi original before quoting. Technical terms follow `MD-Mapping.xlsx` conventions.

3.1 Atomic Structure and Molecular Composition (परमाणु संरचना एवं अणु रचना)

[p. 53]

The desire to recognise atomic structure has been found in the human being from the distant past.

By the method of decomposition, the human being applied thought, reflection, and experiment in order to reach the fundamental substance. Even at the end of decomposition, the expectation of some definite fundamental substance remained.

Experimenting with the above mindset, the human being arrived at this conclusion: that if we keep on decomposing any substance whatsoever, we will reach a state in which the decomposed units function in a self-motivated (*svayamsphurt*) manner — this is understood. Such a functioning unit we call the atom. The desire to understand how all this functions has also remained in the human being.

The atom has, at its middle, one or more particles (*ansh*), and, revolving on all sides in its orbits, one or more particles. Below this, the matter of an atom does not come to be. That the

number of particles in the middle or in the orbit might increase — this arises in human imagination alone.

In this connection, two main questions came to attention — 1. How could recognition come to be established in the mutuality of the atomic particles? 2. After recognition, why did they enter into orderliness? On carrying this line of thought further, it was understood that coexistence itself is its principal cause, because the omnipresent substance (Omnipresence) is fully immersed, soaked, and enveloping within every single object, in energy. The omnipresent substance is all-permeating within all of these. In this way it became clear that, from the subtlest to the largest unit, being saturated within the omnipresent is the basis of remaining energy-endowed. Being energy-endowed itself is understood to be being force-endowed and being endowed with magnetic force. It is by virtue of this force-endowment that in the subtle atomic particle there is the propensity to recognise mutuality and to participate in orderliness. For the human being it is necessary to accept the recognition of one by another as evidence of this force. The human being alone is endowed with the innate right to recognise propensity, action, and result. In this very progression, when human beings recognise one another, there they present themselves in the form of orderliness itself. Wherever they have committed error in recognising this meaning, functioning and behaving in the form of disorderliness, the cause of the problem

[p. 55]

comes to be. In this way it is understood that every atomic particle (on the basis of being saturated within the omnipresent) is functioning in orderliness precisely as a result of recognising one another. The functional form of orderliness is definite conduct itself.

In the above manner, as a result of every atomic particle too being energy-endowed, recognising one another is natural for it; the purpose of this recognising is to conduct itself in a combined form — this was understood as an eternal law. From this a further formula also emerges: that on the basis of such recognising alone does constitution-organisation come to be, and constitution-organisation comes to be evidenced in the sense of orderliness, being the ever-present. In this way, that within the omnipresent substance every single entire object is indivisible, and that this is understood in the form of coexistence, has become easy to comprehend. In this progression, that coexistence is eternally influenced — this is acceptable to us humans.

Coexistence itself became the fundamental formula and the basis of orderliness. At the root of every state of motion, coexistence is well established. In this way it became clear that coexistence itself is the basis of the diverse action (activity) and of the conduct of each one of them.

It was found that difference of conduct comes to be only from difference in the number of functioning particles in atoms. On the basis of such difference of conduct alone, the human being made the attempt to determine the species of atoms and the number of species. Human beings have so far laid claim to there being 108 species of atoms on this earth, and hold the hope of discovering the atom of a further species.

On understanding the atom in this way, we humans become clear in an orderliness-centred mindset. As a result, it became natural for the human being to be ready to recognise the innate orderliness within himself. In this progression it became natural for the human being to understand humane conduct. From this it is found that value, character, and morality — their combined expression, communication, and manifestation — have, within the human tradition, the basis of orderliness, from it, and for it.

By virtue of this very fact, in the animal-order, the plant-order, and the mineral-order — in as many species as are reckoned in solid, liquid, and rarefied forms — at the root of all of them is the atom itself, and jeevan too is the atom. The atom of every species performs definite conduct. Therefore the human being too (who is the combined form of jeevan and body) wishes to live in orderliness with definite conduct. It became natural that the glory of atomic structure comes to be clear only in conduct, and that conduct comes to be in the form of its own activity.

[p. 56]

In the context of atomic composition, this too becomes clear: that atomic particles come to be evidenced only in the coexistence of one another. An atomic particle that remains separate in the limitless void (the omnipresent) does not remain evidencing the intent that is in the form of orderliness; therefore, functioning in a whirling form in the limitless void, it remains in search of another particle. Ultimately, it becomes absorbed into some other atom, or forms a definite atom together with another atomic particle. From this it is learnt that only after the constitution of the atom does the manifestation of orderliness come to be; in the course of orderliness being manifested, the manifestation of conduct comes to be. This itself is clear as the physical, chemical, and jeevan activity-processes.

That atomic structures are based upon one or more particles has already become clear; this too has become clear: that the atom of every species is self-actuated. Their conduct is definite.

The composition of every atom comes to be understood in the form of the nucleus (*madhyansh*) and the particles functioning in the orbits. However many particles are functioning in the orbits, that many particles are also present in the middle; more than that is possible. “Orbits” means the particles circling on all sides of the middle. Such orbits are one or more than one. When these orbits become more than four, the possibility of decreasing, and when fewer than four, of increasing, always-always remains. Such atoms remain present in the forms of their respective species, in various numerical states. Weight remains dependent on the number of nucleuss inherent in these atoms. In this very form, atoms endowed with the inherent-weight recognise one another and gather together — this we call the molecule. Such molecules are found in solid, liquid, and rarefied forms. Solid compositions have already become clear as the forms of large-large compositions like the earth. Liquid substance is considered the initial substance of the chemical world. All these come to be composed by the compound method. In this the human being has no contribution; the human being only studies it. Study is necessary precisely because through it, recognising the innate functional orderliness with these becomes possible. It is only on the basis of chemical substances that the

activity-process of the prana cells, in the fruition of the composition-of-nourishment-element and composition-element, comes to be clear.

At the root of the physical-chemical activity-process, it is the atom and the molecule alone that come to be recognised as performing the activity. In this way the molecule, in its own form, works continuously precisely in the form of orderliness. The evidence of working in the form of orderliness is that the onward state of motion in the sequence of orderliness comes to be clear (from its being the present).

[p. 57]

Every atom and molecule is found to be a rung of its own species. What is meant by being a rung is its existent-state, its continuity. Just as two particles are in one existent-state in the form of an atom. This itself is one step. Their having definite conduct is itself their grandeur. This very having of definite conduct becomes the basis of the further step, and remains so. Atoms and molecules with various numerical particles remain with their definite conduct established. This itself is a wondrous self-motivated form of orderliness, clear before the human being.

Such physical molecule-atoms, participating in the chemical activity-process, are amenable to study, each in the form of a state of motion. The well-established combining of all these molecules-atoms comes to be clear in the form of large-large compositions like the earth. This is indicative of the fact that however many species' atoms and molecules are necessary before chemical action begins on the earth, that has come to be accomplished by the destiny-borne innate method itself. What is meant by the destiny-borne innate method is the coexistence method itself. Only after there comes to be endowment with the atoms-molecules of all species do the compound propensity and processes come to be accomplished. On this earth the testimony to this is well established.

That all the above manifestations, in the material state, are based upon molecule-atom species, and that the species of molecule-atoms are dependent on the number of atomic particles — this is well established. The changing of the number of particles, and, as a result of the change, the result — such results remain continuously coming to be. The name of this activity-process is absorption-displacement (*prasthapan-visthapan*). In atoms, absorption-displacement remains occurring in order to fulfil the result-oriented intent. In this the intent of the process of being complementary to one another also comes to be accomplished. Before some particle is displaced from any atom, that atom is found to remain excited; it is only as a result of being excited that being displaced from some atom becomes possible. That particle becomes absorbed into some atom. The name of this action is absorption. In this way, after being displaced, the displaced atom comes to be in natural-state motion; the emplacing atom, after absorbing the absorbed particle, having welled up, comes to be in the establishment of natural-state motion. Only in the establishment of natural-state motion does every atom, molecule, and molecular composition come to be clear as accomplishing definite conduct. Definite conduct itself is the evidence of orderliness. In this progression the intent of development remains contained.

3.2 Development Progression, Development (विकासक्रम, विकास)

[p. 58]

In the development progression, the molecules, atoms, and molecule-composed compositions of many species are well established. Just as the earth and many planet-globes are present in existence. All these compositions are the present precisely in the forms of solid, liquid, and rarefied. On this earth these three states are well established. Among these, that which is water, in the form of liquid substance, is itself the very first grandeur of compound action. Water is found to become acid and alkali on the basis of the earth's combination. Only after these come to arise up to a definite quantity does, through the combination of cosmic heat, from the influence of the reflection (the basis for recognition in mutuality), substance-composition in the form of nourishment-element and composition-element come to be found in the water. Its root form is called 'algae' (*kaai*). It is right after such algae that compositions composed from the prana cells have already come to be formed by the single-celled, two-celled, and multi-celled method. This exhibits the development progression in composition. This earth has within it small-large compositions in the form of soil, stone, gem, and metal. As the grandeur of compound action, the compositions composed from prana cells are called the plant-order. All these plant-orders are indivisible from the earth; they remain joined with the earth.

From this it is learnt that on the earth, from the combination of diverse substances, the grandeur of compound action comes to be accomplished, and there comes to be a festival of becoming manifest as distinct from its own root form. This itself is chemical resonance (*rasayanik urmi*). We are calling the festival of chemical substances resonance.

In every prana cell, prana sutras are found to be present. In it itself the composition-element and the nourishment-element remain contained in definite quantity, and the composition-method remains inherent. Such prana sutras remain accomplishing the process of accretion within themselves. In them there remains a festival of multiplying sutras like themselves. For this, the availability of chemical substances and the conjunction of definite heat remains necessary. Such prana cells are found to be formed in the marrow-filled fluids in the hollows of the bones of living beings, of the human being, of the body, and this comes to be distributed as per the body's need. Along with this, from the combining of the prana sutras, many sutras and cells come to be formed. As a result such cells, along with chemical substances, keeping their own existence secure in the form of blood, are found functioning in the composition of the body. In the plant-order, in the sap-circulation system, from the activity-process of the leaf and the root there comes to be accumulation of sap,

[p. 59]

as a result of which prana cells keep on forming. In this way that there is development-propensity in the compositions, in the compositions, that remains contained in the prana cells, is well established. The evidence of this is the very diversity in the compositions. The

various compositions found in the present are testimony to the development progression in composition. In this progression the grandeur up to human body-composition has already become clear on this earth.

From prana cells, compositions manifest themselves in the forms of small-large plants, trees, creepers, and shrubs, and further, in the forms of the bodies of small-large living beings. The prana cells functioning in the compositions of the plant-order, having developed, express change in the composition-method — which becomes the basis of the compositions of the living-being body-order, that too up to the composition of the human body; this has already become clear. In nature (*prakriti*) four states are perceivable. The material state is in the forms of soil, stone, and so on. The prana state is in the forms of trees-plants, the plant-order. The jeevan state and the knowledge state are perceivable in the combined form of body and jeevan. In the composition progression of the body of the prana state and the jeevan state, there is also found to be the sweat-born world. This comes to be seen: that when the residue of the plant-order — dried leaves and so on — gather, upon getting water and heat, many worms-insects arise of their own accord. This itself becomes manifest further in the form of the egg-born world. By this method these are found establishing propagation. This sweat-born world comes to be seen in the forms of the water-dweller, land-dweller, and sky-dweller. The egg-born world, being powerful, comes to be seen in the form of birds flying up in the sky, and in the forms of large-large water-dwellers and land-dwellers. Such an egg-born world joins to the womb-born world. The womb-born world is a composition developed, within itself, from the egg-born world. After the egg-born and womb-born worlds, the analysis-synthesis of chemical substances, coming to be in the form of the seven metals, has become well established up to the composition of the human body.

From the study of the progression of all these compositions and of the human body, this too is learnt: that in the human body the richness of the medhas (*medhas*) composition has completely and fully become clear. The evidence of this is precisely that in the human being, imaginativeness, freedom-of-action, and its satisfaction, in the form of knowing, believing, recognising, and carrying-out through the medium of the medhas, is a unit worthy of expression. The non-human order is limited up to recognising and carrying-out. The basis of recognising and carrying-out is force-endowment itself. This very energy-endowment, force-endowment, has already come to be evidenced, in the living human being, in the form of knowing, believing, recognising, and carrying-out. This is also testimony to the medhas-system being rich. By the above method the outline of there being development in compositions comes to be known. Before this it has already been made clear that

[p. 60]

it is only in the atom that development comes to be. Such developed atoms are constitutionally complete; this itself is the conscious unit; this itself is jeevan. Jeevan itself, keeping the body alive, evidences understanding.

3.3 Development in the Atom (परमाणु में विकास)

Before this, the development progression in compositions has become clear. This development progression has clarified the development progression in composition up to the atom, the molecule, molecule-composed bodies, the plant-order, the animal-body, the human-body composition. The human body is amenable to study as the highest developed composition.

The human body is the highest developed composition precisely because in the human body the medhas composition has already fully developed. From the distant past, the human being has remained desirous of unveiling facts concerning justice, dharma, and truth. In this progression, as many experiments as have taken place, and the need to develop discernment further too, remained. In the course of the attempts, idealist and materialist discernment came into experiment. The fruit-result has already been reckoned within the human family.

The expectation of justice, even today, remains in the human being most of all.

In the above progression, the attempt to understand existence in the form of coexistence, to express it, is presented. On the basis that existence is itself coexistence, the development progression in compositions became clear. At the root of every composition, there being the atom, is clear. That there is development progression in atoms, that there is development, too comes to be understood.

What is meant by development in the atom is the atom's becoming constitutionally complete. In the human being one desire has been present — for the existent-state, grandeur, and its continuity — this is naturally acceptable. That there is decreasing-increasing of particles in atoms, we have already understood in the form of result. The imperishability of the result, the expectation of its continuity, is found in the human being alone in the form of imagination, sense, semblance, and conviction. For this, that there be many attempts is also natural. By the coexistence-oriented method this has become clear: that in the development progression many compositions, states-circumstances have already come to be perceptible. At their root, that the atom alone is functioning, has already become clear. Such a result-engaged atom itself comes to be composed into the constitution-accretion status. For this event, the natural action is the result-method itself.

[p. 61]

In the result-progression, it has become easy to understand atoms in the terms of hungry and undigested (*ajeeran*). Undigested atoms remain in the attempt to expel some of the particles contained within their constitution. Such atoms remain endowed with radiative grandeur. Radiativeness can be understood thus: that in atoms activeness is always-always kept up; in the fruition of activeness, sound, heat, and electricity come to be produced of their own accord. As a result of remaining soaked within the omnipresent substance, they keep energy-endowment and force-endowment maintained. This very force-endowment comes to be reckoned in the form of magnetic force. Therefore, radiative atoms remain expressing undigestedness within their constitution, because from their constitution the attempt to expel some particles remains ever present. In this progression, radiativeness remains produced in such a way that in the undigested atom there is an internal-conjoining of heat toward the nucleuss.

In this very progression electricity too remains present. It is as a result of these two processes that radiativeness remains manifest.

In hungry atoms, the possibility of absorbing some more particles into themselves remains present. This is precisely why they have the name “hungry” atoms. Being undigested and hungry in atoms is understood precisely in the sense of the satisfied (*tript*) atoms (the human being is the one who studies it). Such a satisfied atom — that is, the constitutionally satisfied atom — is found to come to be in the jeevan status. As a result, in the constitutionally complete atom, force and power become inexhaustible. What is meant by inexhaustibility is precisely this: that however much one may express or spend, it does not decrease. However much one may express hope, thought, desire, or evidence, it does not decrease at all, and they remain keen. That is why the name “inexhaustible” has been given. Such inexhaustibility every human being can recognise within himself by examination.

The human being alone is a unit in existence that can study both itself and study the entirety too. By virtue of this very glory, it has already been made clear that the human being is, in the form of its own status-establishment, in the knowledge state. Every man-woman has equal grandeur in the knowledge state. This itself is the formula of mutual equality. To let this formula be forgotten is itself indicative of delusion.

In this way, that jeevan is, within itself, in the form of a constitutionally complete atom, and is in the form of conscious activity-process, and comes to be evidenced through the human body in human tradition — this is well established. That in order to keep this grandeur-establishment maintained, propensities are engaged in the task of studying every human being’s being established, and being disestablished, as fundamental necessity, of understanding it, and evidencing it — this too is clear. In this way the destination of development in the atom is precisely the constitutionally complete status.

[p. 62]

By the above method it has become well established that at the root of physical action, chemical action, and jeevan action, it is the atom alone that is present. Jeevan is a constitutionally complete atom, and, participating in physical and chemical action, the atom is constitution-oriented. From constitution-orientation, weight bondage and molecular bondage come to be found. Whereas the jeevan atom is found to remain free of weight bondage and molecular bondage. The evidence of this is precisely that the hope, thought, desire, resolve, and evidences inherent in every human being cannot be reckoned or enumerated on the physical scale. The physical scale is one means for recognising weight. From this testimony this too is clear: that it is only the physical atom that, passing through the development progression, comes to be understood by the human being as accomplishing the event of transition into the constitution-complete status. By the second method, the atom itself, in the constitution-oriented status, is inert (*jad*), and in the constitutionally complete status, is conscious. Without the development progression, the study of development does not happen at all. The conscious atom (which is jeevan itself) is found, in the form of tradition, studying and evidencing development, the developed status, the awakened progression, and awakening. On the basis of this fact, that the orderliness of awakening coming to be evidenced within human tradition

— that is, the orderliness of human tradition coming to be grand through awakening — is formed by the destiny method. What is meant by the destiny method is the existence-grandeur method that is in the form of coexistence, its process, fruit, result, and its continuity.

Development in the atom is in the constitution-complete status, or in the form of the constitutionally complete atom. The human being studies “is”. What is meant by study is coming to recognise, in existence, the objects indicated by words, through remembrance in the light of experience, from the meanings. In this way, the remembrance of words, and the objects indicated by the meanings of words coming to be clear in existence, is itself awakening. What is meant by clarity is precisely experience within oneself, and being evidenced in action-behaviour.

What development in the atom means, this became clear: that the atom comes to be in the constitution-complete status, and that the constitutionally complete atom is awakened — this itself is destiny. This comes to be evidenced only within human tradition. For this, the body-composition worthy of expressing it has already been formed. In order to evidence its awakening through this body, the human being made experiments of various kinds. But, on the basis that the intent of development in the atom is the constitutionally complete atom did not come to be explained in tradition, the study of the jeevan status could not come to be. The study of the jeevan status comes to be found only in the light of the awakening that occurs in jeevan. That is why speaking of it here has been natural.

[p. 63]

To the extent that the constitutionally complete atom, through delusion, understands the body to be jeevan, it does not remain capable of understanding development in the atom. In the physical, chemical development progression, it is precisely in the course of evidencing jeevan and jeevan-awakening development-fully in the human body and in the atom that awakening comes to be evidenced within human tradition. What the evidence of awakening means is precisely coming to be evidenced justly, resolution-fully, with actuality, with reality, and with truth. What being evidenced means is precisely being, in tradition. In the course of the above five faculties coming to be evidenced, that they naturally come to be evidenced from generation to generation — this itself is awakened tradition.

In the human being this grandeur comes to be seen: that he is found making the research-investigation that has been evidenced as useful, well-utilised, and application-worthy, come to be universalised through education, through study, through practice.

By the above method, however much experiment has so far taken place in giving form to the imaginary, all of that has been universalised. And however much experiment has taken place for mental well-being (*manah-svasthanata*), it has not been universalised. Whereas the very definition of the human being is: the one who gives form to the imaginary, the one who presents the evidence of mental well-being (the idealist certainly exists).

Development-completeness, in the course of development in the atom, remained a transition event. What is meant by transition-ness is precisely: not coming again into the previous

state. Freedom from the result means freedom from the event of some particles decreasing, increasing in the atom.

By the coexistence-oriented method, the human being is grand in the combined form of body and jeevan. Jeevan-awakening itself is the evidence of mental well-being. That which comes to be accomplished only within jeevan, that which comes to be grand — by the experience-based method — the perception of experiences in the intellect (*buddhi*), in the contemplative mind (*chitt*), justly, dharma-fully, truth-fully, in the appropriate weighing-action propensity (in reflection-action), and the savouring-action of values in the mind (*mann*) — is found to come to be. The savouring-action of values comes to be possible in action-behaviour only when the recognition of relationships remains acceptable. Only after recognising relationships does one come to carry out values.

Along with relationships, values; along with values, the dedication-surrender of objects; along with the dedication-surrender of objects, usefulness, well-utilisation, application-worthiness — this is found to come to be evidenced, that is, to come to be grand. This itself is the intent of development in the atom and of awakening. Only the human being is a unit worthy of presenting the evidence of awakening.

Karm Darshan – Chapters 3.4–3.6

(Working English Translation)

Machine-assisted working translation from Manav Karm Darshan (v5), translated from page images (printed pp. 64–72). Not a published translation – verify against the Hindi original before quoting. Technical terms follow MD-Mapping.xlsx conventions.

[p. 64]

Awakening's entire form is nothing but knowing, believing, recognising, and carrying out. The material state, the prana state, and the jeevan state – recognising and carrying out all of these, these units evidence their own conduct in the form of participation in orderliness-with-inherence (*tva*) and in the overall orderliness. Whereas in the human being, along with recognising and carrying out, knowing and believing have remained a necessary process as well. This is found to be evidenced properly only within the human family (*kul*). Knowing and believing, together, attest to the fact of being in the human knowledge-state.

In its root form, the atom alone is the root substance of all activity. In the atom, as the outcome of development progression and development, physical, chemical, and jeevan activity is found to occur. As the constitution-forming atom, the world's grandeur is seen displayed all the way from the material state and the prana state up to the rich medhas-composition.

In the atom, the first stage of development becomes clear in the form of constitutional completeness, as a result of which jeevan comes to be found as an imperishable activity in the form of a conscious unit.

The jeevan atom's becoming awakened (activity-completeness) is the second stage of development in the atom, and evidencing this awakening within human tradition (conduct-completeness) is the final stage.

In this way, development and awakening in the atom are completed in these three stages – constitutional completeness, activity-completeness, conduct-completeness. This itself is the meaning of development in the atom.

3.4 The Nature of Mental Well-Being (मनःस्वस्थता का स्वरूप)

In the sequence of studying physical, chemical, and jeevan activities, it is necessary that the study of the human being be complete. Tireless effort has already been made on this issue in the past. In the human context, whatever study was carried out without recognising human-ness (*manavatva*) – in that, the study of physical and chemical activity too remained incomplete. In the same way, however much study of physical and chemical activities has taken place, on that basis too the understanding of the human being could not be completed. In both ways this can be understood thus: on the basis of however much of the thread of physi-

cal, chemical activity is available to the human being so far, on that basis the human being's thread and

[p. 65]

explanation does not occur. For this reason we humans have not arrived at a position of trusting humans. We, humans living in every country, do trust physical activity, whereas trusting human activity has not yet come about.

Because of this problem, it has not so far been possible to arrive at a determination regarding the human being's human-ness, the human being's conduct, the human being's mentality, the human being's nature. By way of indirect statement, all governing institutions, educational institutions, religious-cultural institutions, technological institutions, and trading institutions keep saying this in many ways. It is precisely the emptiness at this site that has been the reason for the need to understand development and awakening.

This point has already been made clear: that it is the atom alone that participates in physical, chemical, and jeevan activity. It has already been made clear that at the root of jeevan activity is the presence of the constitutionally complete atom. Whether it be physical activity, chemical activity, or jeevan activity — it is on the basis of the conduct of each of these three modes that we are able to determine their recognition, the recognition of their diversity, and the recognition of their unity. We determine the recognition of iron on the basis of iron's forms of conduct. In the same way, we recognise soil, stone, metal, donkey, horse, cat, dog, ant, and elephant, each on the basis of their own respective forms of conduct, and, along with this, we are also able to determine what conduct and behaviour humans are to have toward them.

It is clear that, in existence, the human being is the combined form of jeevan activity and physical-chemical activity (the body). The atom, in its constitutionally complete condition, carries out jeevan activity. It is jeevan alone that expresses, communicates, and manifests hope, thought, desire, resolve (resoluteness, *ṛtambharā*), and evidence (realisation). The testing of this has to be carried out by every human being, both within himself and within every other human being. For this reason the human being is an object worthy of study in the human being, by the human being, for the human being.

Mental well-being can be called happiness. This is the realisation and the evidence of resolution. The evidence of mental well-being — that is, in the tradition of behaviour — has been found to occur in the form of evidence being resolution. Along with this, the human goal has been recognised in the form of resolution, prosperity, fearlessness, and coexistence, and every man and woman can have the realisation of this. It has also been found that resolution alone, in realisation, is happiness. The evidence of happiness is resolution in behaviour. In this way resolution came to be anchored. It became clear that resolution is the expression, communication, and manifestation of jeevan activity, or of mental well-being, or of jeevan awakening.

[p. 66]

Mental well-being is a most necessary issue in, from, and for human tradition. Only with mental well-being does the human goal come to be evidenced. In the process of the human

goal becoming meaningful, the human being becomes ordered within himself, and participates in orderliness.

The principal reason that orderliness in the human being is not confined, in itself, to chemical-physical activity, is the presence of jeevan activity in the human being. Every human being is indeed the testimony of jeevan activity. Although jeevan activity does occur in animals as well, in animals it is confined to acting in accordance with the jeevan-body, because every animal keeps evidencing its tendency and its actions by the hereditary method alone. This has been seen to remain confined to the meaning of sensations. Whereas in the human being, the effect of both jeevan cognisance (knowing, believing) and sensitivity (recognising, carrying out) is seen. In the animal order only sensations have come to be evidenced, whereas in human tradition both cognisance and sensitivity come to be evidenced, and every awakened human being keeps sensations under control by means of cognisance. This is the fundamental distinctiveness of the awakened, or natural, human being. Therefore it is precisely this — that sensations be controlled, balanced, and purposeful by means of cognisance — that is the human being's fundamental distinctiveness. In this sense, the whole of purpose comes to be found as the evidence of cognisance.

The definition of the human being is meaningful in the sense of giving concrete form to ideas (*manakar*) and evidencing mental well-being. This is accepted in, from, and for every human being. The human being does indeed want to have a healthy mind (*manas*), and does keep on giving concrete form to ideas. This can be tested in every country and time. In this way it is self-evident that the human being, as the combined manifestation of chemical-physical and jeevan activity, is distinct from other kinds of nature — such as animal nature, plant nature, and mineral nature.

According to coexistence-ist thought, according to knowledge, wisdom, and science, it is necessary for all humankind to adopt education-and-culture in the sense of the human goal. In this, it is necessary that conduct replete with humaneness remain clear in the sense of the human goal, because it is only on the basis of conduct that the fulfilment of the goal of each of these states becomes intelligible. For instance, in the material state, on the basis of the outcome for the whole substance, one gets to see conduct acting toward the goal in the form of its actual condition (*yatha-sthiti*). In the same way, in the prana state and the jeevan state too, all the units at work are seen acting for the sake of the goal of each of those states — for example, the prana state is seen making the journey, in the sense of existence together with growth (*pushti*), from seed to tree and from tree to seed. In this

[p. 67]

way the entire animal order is seen acting, together with existence and growth, in the hope of living, by the hereditary method. Having seen such entirely clear conditions, it also remained necessary that human conduct be in the sense of evidencing happiness together with existence, growth, and hope — and it is for this very reason that the evidencing of mental well-being remained natural.

Human conduct is found to become clear in the combined form of value, character, and ethics. Only on the basis of fundamental distinctiveness does the evaluation of values come to

be; in the human being, the carrying-out of relationships, its continuity, and its acceptance, is itself a fundamental distinctiveness. In this very sense, the recognition of relationships, the carrying-out of values, evaluation, and mutual two-sided satisfaction, or mutual satisfaction, are found to occur. This is what is meant by value and fundamental distinctiveness. The second part of conduct is character, which is found to become entirely clear in the form of fidelity to one's own wealth, one's own wife, one's own husband, and compassionate work-behaviour, by which the human being's fundamental character, or universal character, becomes entirely clear. In the third mode, ethics is found, in the human being, to be the expectation of, and the evidence for, moral policy and the state's economic policy. As evidence, every awakened man and woman is found presenting himself in the form of the protection and proper use of the wealth that is body, mind, and money. Of these, the protective methods are known by the name of statecraft; the methods of proper use are known by the name of moral policy; and production beyond the family's need is known by the name of economic policy.

By the coexistence-ist method, every human being is a unit worthy of participating, together with human-ness, in orderliness and in the overall orderliness. In this, the principal issue is just this: there is need to accept, through study, that one's own self, for one's own self, is in the combined form of chemical, physical, and jeevan activity. It is extremely necessary that the glory of jeevan activity, and its necessity within human tradition, remain kept in mind. Only then is the human being found ready for research. Such readiness comes to be proposed, by the natural method of awakening, in the sense of universal wellbeing. Only then does the situation become clear of all humankind expressing itself with resolution, and of every family becoming resolved and happy through understanding; as a result, the good fortune of prosperity, fearlessness, and coexistence being brought to bear comes about — this is the principal point. This is also the evidence of universal wellbeing, because it is only with resolution and prosperity that the human being experiences happiness and peace. In this same sequence, contentment and joy, together with resolution, prosperity, fearlessness, and coexistence, are found to be entirely meaningful in themselves. In this way, once the human goal has become meaningful, the jeevan goal (happiness, peace, contentment, joy) does indeed become meaningful. Jeevan

[p. 68]

goal and the human goal becoming meaningful is itself the universality of study and teaching. With such a goal, human tradition itself becomes, in itself, the thread and the explanation for recognising oneself and for recognising the whole of humankind. As evidence, it is found to be an explanation; as understanding, it is found to be a thread. This is found, by the natural method of destiny, to remain appropriate. What is meant by the method of destiny is development progression, development, the awakening sequence, and the tradition of natural evidence for awakening. By the second method, it is in the form of the combined expression, communication, and manifestation of the physical-chemical composition, the body, and jeevan activity.

The human goal — evidencing resolution, prosperity, fearlessness, and coexistence naturally, and, on that basis, the jeevan goal (mental well-being) — the evidence of this, in the sense of

making happiness, peace, contentment, and joy meaningful, is precisely why the necessity of human education-and-culture has remained in place for ever and ever. The success of this alone is the good fortune of the human family.

The Meaningful Evidence of the Human Family and of Chemical-Physical Activity (मानव कुल और रासायनिक-भौतिक क्रियाकलाप का सार्थक प्रमाण)

The entire substance of education lies, within coexistence-as-existence, precisely in the form of chemical, physical, and jeevan activity. Of these, in their indivisible form, is the entire activity, behaviour, thinking, and understanding of human tradition. It is in the sense of understanding alone that every human being has to carry out study. Understanding, in itself, is found evidenced in the forms of knowing, believing, recognising, and carrying out. It is in this very sense that the whole of study is found to be meaningful.

In existence, the whole of units is indeed reflected in the forms of chemical, physical, and jeevan activity. From the constitution-forming atom up to the molecule, the molecule-composed body, the prana-cell, the plant order, and the animal order — all of these, remaining within their own orderliness, are found intelligible as they express their own determinate conduct. Of such evidences, this earth is the greatest evidence. The earth functions in the form of an orderliness. It is precisely the evidence of functioning in the form of an orderliness that, on this earth, chemical-physical and jeevan activity is manifest in the forms of the material state, the prana state, the jeevan state, and the knowledge state. What greater testimony could there be than this? On the basis of this testimony — that is, according to the determinate activity of the material, prana, and jeevan states — the human being can trust in his own being within orderliness.

[p. 69]

The thread and the explanation for the human being to live, by the natural method of existence-as-coexistence, in the form of orderliness of and by himself, comes to be understood by the self-motivated method.

By the coexistence-ist method it becomes possible to recognise the whole of humankind as one undivided society (*akhand samaj*). It is the complete understanding of the mentality of undivided society, in the form of knowledge, science, and wisdom, that keeps the weave of universal orderliness clear. It is only in the sense of such universal wellbeing that the human being came to be found meaningful in the form of orderliness. Therefore the accomplishment of universal orderliness is, for the human family, the ultimate glory, the thread, and the explanation. In this way it is found that it is precisely with human consciousness that the human family's own tendency to participate in universal orderliness, in undivided society, comes to be self-motivated. The sole reason for this is that, by the coexistence-ist method, the human being recognises himself.

In the conduct of humankind, dharma predominates; in animal species, disposition predominates; in plants, property predominates; in material things, form predominates. It has already become necessary that human dharma, in itself, evidence resolution on the basis of

happiness. All-round, resolution-complete education-and-culture is itself the tradition and the source for this. This itself is awakened tradition.

3.5 Coexistence Is Stable; Development and Awakening Are Certain (सहअस्तित्व स्थिर है, विकास और जागृति निश्चित है)

Existence-as-coexistence is stable. It is in coexistence alone that development and awakening are certain. We human beings on this earth have already arrived at a condition fit for studying this fact. The seer, doer, and enjoyer of universal wellbeing, and the bearer and carrier of the knowledge, science, and wisdom obtained at its root from education-and-culture, is the awakened human being alone. This fact is found, in itself, to be well understood. It is only with coexistence-ist philosophy, knowledge, science, and wisdom that every human being comes to evidence himself, in the sequence of the event of universal wellbeing, naturally in the form of orderliness, and comes to participate in the overall orderliness. This itself is the reach and the manifest form of the programme of universal wellbeing. For this — that is, for universal knowledge, science, and wisdom — study alone is the one and only source. The nature of knowledge and science, in itself, is complete knowledge only when it comprises: the knowledge of existence-as-coexistence philosophy, the knowledge of jeevan in the form of conscious nature, the knowledge of activity-behaviour in the form of conduct replete with humaneness, and the knowledge of participating in the overall orderliness. Of these, existence-as-coexistence comes to be studied in four states and in four categories (*pad*). Its root form, in the pervasive substance, is that each and every single substance

[p. 70]

remains submerged, saturated, and enclosed within the whole. This alone is the ever-present form of coexistence. This does not, in itself, undergo decrease or increase; it does not expand or contract; in every circumstance, its being and remaining continue precisely according to the manifestation of development and awakening. In the mutuality of units, at certain good distances, there is indeed an arrangement in every unit for natural-state motion to be evidenced. Because it has been found intelligible that it is only when every atomic particle is in a position to recognise other atomic particles that determinate conduct comes to be fulfilled as the outcome of atomic constitution. It is precisely determinate conduct that bears the name natural-state motion. Therefore, in the establishment of natural-state motion, every unit, or the whole of units, is found seen and understood as participating in orderliness-with-inherence and in the overall orderliness. This same state is also disclosed from the study of oneself. In this sense, development and awakening are certain.

We human beings have the tendency to participate, together with human-ness, in orderliness and in the overall orderliness only in natural-state motion — that is, only after the accomplishment of natural-state motion, with awakening. Such natural-state motion is found to occur only after awakening. Awakening is evidenced only when the human being becomes accomplished in understanding, honesty, and responsibility, as a result of which he evidences, with participation, his own glory, his actual condition. In the second stage it also became un-

derstood that the human being alone is fit to be the one who understands. Only after understanding stability and certainty does the human being himself become capable of being honest and responsible in respect of certainty and stability. As a result he is able to be evidenced with participation. Therefore it is necessary for the human being to be understanding; the expectation of this — that is, the expectation of understanding — is found to be present in all humankind.

3.6 The Stability and Certainty of Realisation and Awakening (अनुभव और जागृति की स्थिरता और निश्चयता)

Certainty and stability have indeed remained formed in all humankind in the form of an abiding aspiration (*chira-akanksha*). Existence-as-coexistence is the basis of knowledge and acceptance. This is a fact that comes to be known in all humankind through survey. This becomes clear also from examining oneself. All of us have continued to accept stability and certainty alone, and not instability and uncertainty. It is natural for certainty to occur only on the natural basis of stability. The certainty natural to development and awakening is evidenced, in all humankind, in the form of jeevan activity. It is natural for all humankind to study the five activities of jeevan in the form of state, and five activities in the form of motion. In carrying out this study

[p. 71]

too, it is the human being alone who is engaged. It is the human being, too, who evidences after study, and it is the human being, too, who lives in evidenced form. In this way the human being alone is the evidence of awakening. Jeevan activity is found, in the form of motion, to occur in all humankind in the forms of selection, analysis, desire, resoluteness, and evidence — this itself is projection. Along with this, the five activities of state are found in the forms of tasting, comparison, contemplation, enlightenment, and the activity of realisation. Only then does human tradition come to evidence the evidence of realisation. The five activities of state of jeevan are expressed as force, and the five activities of motion are expressed as power.

The selection made by awakened jeevan in the sense of relationships, their being carried out, and their purposes, is hope — the hope of living with happiness; this is the first power of jeevan. Second: in accordance with hope — that is, analysis being accomplished on the basis of the hopes natural to awakened jeevan — this itself is thought. Third: the continued forming of images in accordance with the analysis of awakened jeevan is itself desire. Fourth: the putting-to-purpose and putting-into-practice of the justice, dharma, and truthfulness of awakened jeevan is resoluteness (*rtambharā*). Fifth: the designation of authenticity given to the evidences natural to realisation. In this way the human being comes to understand the presence of five powers. In the same way, five forces too have their authentication —

1. In awakened jeevan, the activity that is realisation and its continuity is *atma*.
2. The activity that gives right enlightenment of realisation as it actually is — that is, that fully accepts it — is *buddhi*.

3. The activity that maintains the continuity of accepting justice, dharma, and truth in accordance with realisation, namely contemplation, is *chitta*.
4. The activity that compares, by the realisation-based method, the justice, dharma, and truth that have been directly recognised, is *vritti*.
5. The activity that, in accordance with comparison, expects, or tastes, the entirety of value, character, and ethics, is *mun* (mind).

In this way, the clarification of the five forces and the five powers is given in the form of the activity that occurs in jeevan.

In the awakened human being, evidence, or the entirety of evidence, within existence-as-co-existence, is nothing but the light of realisation. In the light of realisation, no substance other than evidence remains contained at all. For this reason evidences are also indicated by the names supreme, sacred, and complete. In the second stage, the supreme acceptance of the evidences of realisation is in resolves; the forming of images of resolve is in desires; and of such forming of images —

[p. 72]

of analysis — is in thoughts. It is intelligible that the selection activity of such thoughts, by the tasting-based method, comes to be accomplished in hopes. By the realisation-based method, certainty becomes clear across all ten activities.

In the discipline of the accomplishment of jeevan-knowledge, this is a matter fit for study. It is meaningful that the activities of state be realisation-directed and be expressed by the realisation-based method, and be evidenced by the realisation-based method. There is no third meaningful process or method in existence, in, from, or for human tradition. By the natural method of the human being, this alone is found, on the basis of necessity, to be the ultimate (*param*). The human goal's becoming meaningful is itself what comes to be recognised, and understood, as the ultimate necessity. As a result, the human being is also to be seen becoming earnestly active (*sachesht*).

That the human goal is resolution, prosperity, fearlessness, and coexistence — this is found to be evidenced only by the realisation-based method. Realisation is the evidence and the activity of glory natural to jeevan. It is only on this basis that it is fitting for the tradition of evidence to be fulfilled within the human family. In this same sequence, the good fortune of evidencing certainty for us becomes clear. This is fitting for every man and woman.

Realisation alone is the ultimate expression, communication, and manifestation of awakening and of jeevan. What is meant by ultimate is that it is never more than realisation; jeevan remains incomplete in anything less than that. It is found that satiation (*tripti*) in jeevan comes about through realisation. Jeevan-satiation, in itself, is what comes to be recognised, in human tradition, in the forms of happiness, peace, and contentment, on the basis of resolution, prosperity, and fearlessness. In coexistence, realisation alone is the ultimate; this itself is joy. The evidence of this is ultimate in, from, and for human tradition. The evaluation-system of these — that is, of the human goal — remains contained within orderliness; this itself is the justice-and-security system. By the method of justice and security, the human be-

ing is found to remain trusting and assured in every state and motion. As a result, the path remains cleared for the entire glory natural to jeevan to be evidenced within human tradition. This itself is awakened tradition. The evidence of jeevan-satiation is the human being's being a participant in undivided society, in universal orderliness. It remains natural that, once there is orderliness within human tradition, it is by the method of orderliness alone that resolution, prosperity, fearlessness, and coexistence come to be evidenced. This itself is the evidence of awakening, and the evidence of the whole of human jeevan as well. It is the ultimate glory of human tradition. Orderliness in the form of purpose is indeed the highest attainment of human tradition. In these very attainments, stability and certainty are clear.

Karm Darshan — Chapters 3.7–3.8

3.7 Heat and the Earth's Balance (ऊष्मा और धरती का संतुलन)

[p. 73]

We see nature-other-than-human (*manavettar prakriti*) as the greenery spread out upon this earth, replete with mineral wealth, and as the world of living beings. This earth is endowed with mountains, forests, rivers, streams, and living animals. Endowment means that all these are indeed present on this earth. The earth has minerals contained within itself in solid and rarefied form, and the chemical world spread out upon it is seen to exist in solid, liquid, and rarefied forms. Many things in solid form are indeed to be seen. For example, the bones formed in the body

[p. 74]

do remain in solid form. Such things, before becoming solid, do remain in liquid form. Chemical liquid, being combined through conjunction with heat by the disintegration method, remains present in rarefied form. This means that by the heat method a thing begins to expand. If heat is made to enter into some solid thing, then that thing begins to spread into more space than its definite volume-form. It goes on expanding until it becomes liquid, becomes rarefied.

We recognise heat by this method: the effect that occurs when a thing burns or is burnt — to this we are giving the name heat. We are able to recognise it in another way as well: a thing that has become more excited is always heated up. That is, its temperature increases. It is the human who recognises temperature. The rest of nature is affected by temperature. Setting the human apart, temperature does not get recognised by any measuring standard. To deploy temperature in experiments and to be able to assess the resulting outcomes is accomplished only by the human — that is, only the human carries it out.

Recognising occurs in both material and conscious (*jad–chaitanya*) nature; in recognising and fulfilling, material nature stands evidenced. Whereas knowing and accepting occur only in conscious nature, in the human. The human, while being in the combined form of the material and the conscious, is endowed with the capacity for knowing-accepting. On the basic point, recognising too is an activity. One substance projects temperature for another; whatever temperature they express out of themselves, the molecules and atoms around them ac-

cept that temperature. This is what we are calling recognising. As a result, transformations come about. For example, whatever heat is deployed for melting iron, the iron accepts it; the molecule and atom of iron accept it. As a result it melts. We humans explain this activity thus: it recognises, it fulfils — only then does it melt. The human alone is such a unit that changes heated iron into various shapes; this is what we regard as casting into a mould. In this, the iron keeps on projecting heat until it sets again, until it becomes cold. All the substances joined with it apportion the iron's temperature to themselves. Eventually the iron becomes cold.

In the effort to stimulate temperature — that is, in the activity of manifesting and increasing temperature — there is always the conjunction of one that burns and one that makes burn. For example, coal is what burns; the air keeps making it burn. Going to its root, for burning coal in the initial stage some burning thing or other is there in the role of the igniter — such as burning fire. Proceeding by these methods,

[p. 75]

the human is seen carrying out the activity of stimulating temperature from coal, wood, natural gas, petroleum gas, or by the radiative process. Along with this, the identification of explosive substances, their combination, and heat-stimulation by the pressure method is also being seen.

Deploying such heat, humans do accomplish necessary tasks — such as heating water, cooking food, warming a room, drying medicines, and so on. In the same way, the human does carry out numerous activities by the conjunction of heat, under control. The human tradition has become habituated to this. Wherever temperature may be, it needs to be more than the temperature of that environment — only then is it temperature. Put another way, wherever there is temperature, there has to be less temperature around it; only then is the greater temperature projected toward the lesser temperature. Just as, wherever we light a fire, greater temperature comes about there. The activity of being projected toward lower temperature is seen thus: where temperature remains manifest, it spreads through the molecules and atoms around it becoming heated. This means that heated molecules, spreading temperature into their sphere of influence, into the environment, make heated those molecules which remain lower than its temperature. The molecules-atoms of the environment accept this and carry this sequence forward. In this way temperature, being projected, goes on diminishing, and eventually they arrive at normal temperature. Normal temperature means being in natural-state motion (*svabhav gati*) (natural-state motion means the existent-states that there are in development progression, development, awakening progression, and awakening — that is, orderliness with inherence (*tva*); participation in the overall orderliness itself is natural-state motion).

An experiment of this can be done as follows: light a candle and place it in one corner of any room, or light a kerosene lamp, or a heater, light a stove, or light bulbs giving as much light as possible; the amount of heat we feel on touching it will be felt as less at some distance from it, still less farther away, and least of all in the opposite corner — every student can ob-

serve and test this. If the same experiment is done placing it in the middle of the room, it becomes known that heat is projected equally in all directions.

[p. 76]

In the same way, by the above experimental method we can also accept that the sun's heat is being projected equally in all directions. The heat projected from the sun's orb touches the earth in its facing-ness toward the sun. Along with this it is also understood that, as the earth rotates, the part that remains facing the sun becomes heated. For this very reason sunrise and sunset occur. Even at the time of setting, a minimum of heat remains touching the earth. In the middle between these two, midway, the maximum heat remains touching it. Every person can test and observe this.

It is by virtue of the earth's rotational motion that the configuration of being toward and away from the sun becomes clear. The vibrational motion occurring in step with the dance of this very rotational motion is its form of being evidenced in circumambulatory (orbital) motion around the sun. At the root of this is the very tendency of orderliness with inherence (*tva*). This tendency is in the form of evidencing orderliness while remaining at a mutually good distance. In this sense, definite fulfilment is present in every reciprocity — that is, it stands evidenced. In this way this earth is seen circling around on all sides, keeping in tune with all the planets and orbs participating in this solar system, being toward and away from the sun, remaining at a definite good distance from the sun. Thus this circular motion-path being not perfectly round but elliptic (elliptical) — this is the tendency of the matter. The principal intent of this tendency is the self-inspired tendency of seasonal change in the earth. Ultimately, the intent is precisely that development progression, development, awakening progression, and awakening be evidenced on this earth. How are we humans to understand this intent?

The above point comes to be understood in this way: on this earth all four orders are displayed. What was not, does not come to be. On analysing this fact it becomes known that the root tendency of these four orders remained contained in the material order itself. Had this not been so, the arising of compounds and of greenery would simply not have been possible — whereas on this earth compound activity has been carried out, greeneries have spread. Along with this, from tiny insects and worms up to numerous beasts and birds, the emergence of living animals and their tradition has been established. Not only this, the human body tradition has also been established. The human has no logic or standing for denying any of these. Second, the human's standing is just this: the human studies what 'is'. All four orders are objects of study for the human. From studying, we get the thread of this fact: that on the earth, from the seasonal-sequence orderliness itself, or from its influence, from complementariness, from the physical activity orderliness itself, the chemical activity orderliness

[p. 77]

has emerged upon this earth. In this very sequence, the formations of all four orders have become fully clear. All minerals too, in solid form, are presented as the molecular formation of their own respective species or as mixed formations. On the basis of the various species of these, the compound happening, chemical resonance (*urmi*), and grandeur — that is, dance

— has taken place. On the basis of chemical substance, the entire biological cell (*prankosha*), the structures composed of biological cells, plant species from small to large, animal-order species, and the formation of the human body species stand evidenced on this earth itself. From this it became clear that, together with energy-endowment, force-endowment, and activeness, the tendencies of development progression and development remain contained therein.

That jeevan is in the developed stage has been made clear before. It remains in possession of the constitutionally complete stage. In this constitutionally complete atom itself, the arrangement for being in motion according to hope (*asha*) remains in place. It is self-inspired that jeevan, remaining in motion according to hope in this way, by force of hope operates the bodies of some animal order or knowledge order. The possibility of such jeevans reaching from any one earth to another earth remains within reach. All told, it comes into human understanding that on every earth, development progression stands evidenced in the form of chemical-physical formations and their traditions. From this it has become clear that every earth, maintaining a certain definite distance from some enriched earth, working in the form of participation in orderliness, keeps evidencing in itself development progression, development, awakening progression, and awakening. The seer of all this is the awakened human alone, not the deluded human. In this sequence, many earths are indeed at work in some order or other. All undeveloped earths are engaged in moving toward evidencing development. This too is an indication of the fact that all the earths that are in an undeveloped condition — that is, those earths in which development progression has not even manifested — all such earths keep up their tendency toward setting development progression in array. In this same sequence, the notion is current in the human tradition that the sun-orb, which is in the ultimate condition of decline, will also in the course of time be in development progression. All these situations have become clear on the side of development and awakening occurring. In whatever order an earth may be, the root seed of evidencing development progression and development remains contained in it. Because every excitation is understood to be working toward normal motion, toward natural-state motion; natural-state motion toward development progression; development progression toward evidencing development; development toward evidencing awakening progression; awakening progression toward evidencing awakening, and toward evidencing the continuity of awakening. By this method we can trust in the fact that the entire

[p. 78]

coexistence is active with balance precisely in the sense of displaying development and awakening according to the existent-state. In this very sequence, one sees the presence in several planet-orbs of maximum heat such as there is in the sun, and the absorption of heat into all those planet-orbs facing them in which less heat remains. In this sequence, how much effort (*śram*) this earth has performed within itself — this becomes evident to every awakened human.

On the upper surface of this earth are found forests, oceans, and, in a small part, desert. Whatever kind of forest it may be, most of the trees and plants, creepers and shrubs of the

forest, making the substance known by the name apana air (*apan vayu* — carbon dioxide) their food-material, or making it their digestion-material, provide the prana air — that is, oxygen. Whereas coal, and the oil-petroleum derived from mineral coal — in all the machines in which these are used as fuel, or where they are used by the technological method in the operation of machinery — the life-fatal air (carbon monoxide) found in the discharged fuel-residues of all these is being regarded as extremely fatal for the environment. From this it becomes known that, at the root of such mineral coal, the great forests which, having been buried in the earth, are today manifest in the form of coal — those forests, before being buried, had digested that very substance within themselves; making this their food-material, they must have become sky-kissing trees. It is natural that the conception of such sky-kissing-ness be made on the basis of the thickness of the mineral coal formed in the earth. At present, in some places, a coal seam of 150 to 180 metres' thickness lies deposited. From this an estimate can be made of how enormous the trees must have been. For one metre of coal to form, at least ten metres of tree length is required; everyone can understand its density by the mathematical method. Thus, what a forest of great trees there must have been to make such immeasurable coal can be worked out only by the mathematical method. It is very difficult even to fit into ordinary conception; what can be brought into conception is just this — that there must have been sky-kissing dense forests. Such forests, buried inside the ground, must have become coal over hundreds of thousands of years; that same forest must have been digesting the life-fatal air (carbon monoxide); now that same thing produces carbon monoxide. At present, plants digest carbon dioxide and produce oxygen. All this has become known to the knowledgeable and the scientists. We are mentioning this matter here for this reason: what is its purpose for this earth?

[p. 79]

We have understood the point that coal, carbon, absorbs heat. It takes into itself as much of the environmental heat as possible. An experiment of this can be done as follows: coat one uniform patch of ground with coal; coat another similar patch with white. At the time of harsh sunshine, where the coal is coated, placing one's foot there feels hot; where the white is coated, it feels less hot. The conditions in between these two can also be seen in other places. From this it becomes known that coal digests more and more heat into itself. It distributes it slowly. From this evidence we come to understand that the cosmic heat reaching this earth — of which the greatest is the sun's heat — needed to be digested on this earth. Because it was only after the earth maintained its heat balance that greenery remained secure on the surface of the earth. Only after greenery remained secure did the emergence of worms, insects, and animals occur, and only after that the emergence of the human — this we humans understand as the sequential formation-grandeur. At the root of this grandeur, the earth's maintaining heat balance within itself has been a principal attainment. In this, the human made no contribution. It is the oil contained in this very coal that, maturing in the earth along with mineral substances, has become available in the form of mineral oil. Its preservation too remained ensured inside the earth, with the protective shield of a suitable environment.

Keeping it secure means precisely maintaining an environment such that prana air, i.e. oxygen, is not allowed to reach the oil.

In this way we arrive at the fact that, in step with the earth's vibrational motion, there is vibration and pulsation in the whole of the minerals; more pulsation than that in chemical substances; more pulsation than that in prana air; and as a result, formations stand manifest on this earth. All these are in the sense of manifesting such balanced formations; prior to this is the entire activity accomplished in the background; hence all these have been carried out lawfully indeed — the orders stand manifest with control and balance. We humans need to understand this well, and there is need to set ourselves in order by the method of preservation and enrichment with diligent study. At the root of the human's being in order is the clarity of a harmonious, music-like working of knowledge, science, and wisdom. This very working, being deployed in language and in work-behaviour, propounds the purposes. The human's purpose is precisely to evidence resolution, prosperity, fearlessness, coexistence.

[p. 80]

In this sequence, humans by their own logic think thus: when the sun becomes developed (natural-state motion), from where will heat be obtained for the earth; how will these greeneries remain on this earth; all these greeneries are due to sunlight. The thread of the resolution of this is found in the human ourselves, at the very first step. A definite heat (temperature) arrangement of the human body is in place. According to our measuring standard we put it at 98°–99° Fahrenheit. The name of the measuring standard is taken to be the thermometer. This fact has been seen in the living, breathing human on the earth: where the temperature is below 0° Fahrenheit, humans live there too, and the temperature of the human body of the humans there is also measured as that same normal temperature. On this earth where heat of more than 120° Fahrenheit holds sway, there too the same normal temperature of the human body is being measured — only then is the human said to be healthy. If the temperature changes according to the environment, one is called sick, or is said to have died. On the basis of this evidence, the health of the earth can also be considered. The cosmic rays and heat in the earth's environment that, being projected, touch the earth — so that the earth's temperature neither rises nor falls from this, the earth maintains in balance, from within its own self, a heat-digestion arrangement; this has been described before. This is contained in the earth in the form of the seam of coal. The human, out of his own indiscretion and out of greed, tore open the earth's belly, extracted the coal, and the earth became heat-afflicted. No scientist, nor the technological world, is prepared to accept this responsibility. Its remedy remained set aside. By this method where will we arrive; what can happen? The form of the first evil consequence is that, after the earth becomes heated by a certain amount, greenery, animals, and the human will not be able to remain on this earth. In the second situation, after the earth becomes heat-afflicted, in the event of the melting of all the ice stored at the north and south poles, there can be a state of submergence in water everywhere except the high mountain peaks. What the condition of the human can be in such a situation, all can imagine. The situation of the third evil consequence can also be this: whenever on this earth the compound activity in the form of water was accomplished, a situation must certainly have

formed of one burning and one burn-causing substance joining in a spontaneous way. At that time, for keeping both the burning and the burn-causing sub-substances normal, the cosmic ray alone has been serviceable. Today's human has come to recognise such cosmic rays — alias the world of radiation and radiativity. On keeping this matter in mind, the conception described below comes to attention, even if the said event should not occur. Today, out of our own indiscretion and greed, we go on making the earth heat-afflicted;

[p. 81]

as a result, the possibility of the earth's safety has become slight. The quantities of prana air have gradually begun to decrease; the substance hostile to prana air has begun to increase — this is what we are calling pollution.

In such a situation, the cosmic ray, which has been the combiner for water to form, can, by force of combination with such pollution, become the cause of the opposite event (the cause of the disintegration of water). In such a situation what will become of the human? For this dreadful catastrophe upon the breast of the earth — all of us who are called scientists, knowledgeable or ignorant, who are called the helmsmen of the technological world — do these have any answer to it? No one is to be seen giving an answer to this matter. Because no one accepts responsibility. This itself is its testimony. There is difficulty in accepting responsibility, because a person becomes answerable for atonement. Therefore, effort toward its correction alone appears to be the sole duty. Its propriety finds acceptance with more and more people.

The fourth calamity: on the basis of the earth becoming heat-afflicted, the deflection of the earth's magnetic field of influence is also one possibility. In this earth, between the north and the south pole, by a self-inspired method, a magnetic current or magnetic field of influence has formed. This matter too has been accepted. On this very basis, direction-indicating instruments and apparatus have been made and put to use. By this method, the bondedness that pole has maintained with pole — on this very basis the unbroken work of the earth's being solid kept being carried out. By this, layer upon layer of the earth, heat-collection, digestion, and equilibration kept being accomplished. By this the earth's health — the arrangement of remaining balanced in respect of temperature — has persisted. At present the human does make the declaration of the earth being unbalanced, but does not accept his liability for it; therefore, the searching out of remedies does not come about; as a result, resolution does not come about. In this sequence, the possibility of temperature increasing further in the earth is being accepted. This warns of the following: the magnetic current bonded from pole to pole, after reaching a certain temperature, can be deflected; from this it is natural for this earth, instead of being solid in itself, to begin to scatter. After this scattering, it comes into human imagination in the form of dust. After that, where will the human remain, where will animals remain, where will greenery remain, where will water remain, where will the arrangement of water's cyclicity remain? All these inverse events are indeed in a position to wound the human psyche considerably.

[p. 82]

The undertaking of its remedy is just this: whatever work is to be done from coal and mineral oil, its alternative will have to be identified. Stopping the use of coal and mineral oil is the sole remedy. Along with this, we have already accepted that the radiative fuel system too is fatal for the earth and for the earth's environment. Fuel by the radiation method is fatal; fuel by the coal and mineral method is also fatal. To stop their use is the human's first duty. The second duty is to obtain the alternative of a fuel arrangement for maintaining human convenience. This alternative is apparent in a natural form — converting flow force into electrical energy. From the provision of this single source, by a pollution-free system, electrical energy can become available in excess of need. Along with this, for becoming prosperous: the pressure of wind, the pressure of ocean waves, cow-dung gas, natural gas which in a natural way keeps moving from within the earth toward the sky — making full use of all such sources is in the human's interest, is in the sense of human happiness and prosperity. For those machines which run only on oil, the research into making edible and non-edible oils (obtained from plants, from trees) machine-usable by various combinations should be completed. Only then can the human also maintain the conveniences obtained from machines. Fuel prosperity can remain intact. For oil purposes, the introduction of oil-bearing trees in the forests is certainly possible; this can also happen along roads and in parks and gardens. It can also be on the boundary-ridges of farmers' fields; this is a programme to be accomplished solely on the basis of good sense in the human. In the upper surface of the earth there are vast possibilities — of creating energy sources, of creating fuel sources. Pressure sources, flow sources, solar energy sources — all these are naturally there in abundant measure. Along with these, the possibility of the multiplication of oil-bearing trees is on the earth itself. Inside the earth there is no source of this kind at all. What is there is only for keeping the earth healthy. If we test and observe rightly, the entire source of good fortune is on the surface of the earth itself. Inside the earth, no source equal or similar to the upper part is to be seen.

In this same sequence one more fact is worth remembering. Attention went toward the earth's nether (deep-ground) water source; in a mere 25–30 years the nether water source became depleted in most places. As a result, the surface water source dried up — ponds and step-wells dried up. The human set off toward ruin. Give a little attention to this issue. However vast the upper part of the earth is, with every 10

[p. 83]

feet the vastness goes on decreasing. Every student can test and observe this. For instance, draw a round circle — this is easily made by hand, and can be made with a compass too. After that, draw circles inside, one at each halving; the circle drawn inside goes on becoming smaller. In the same way, the earth's inner surface goes on being smaller than the upper surface. We humans, out of delusion, went grappling with the hope of getting more from the nether sources than from the upper surface. From this too an unprecedented loss has already occurred. If meaningful thought is given to this issue, it becomes certain that the source of the nether water is nothing but the water flowing on the earth's upper surface. In the upper part of this earth water is spread out, is flowing; their cyclicity remains ever intact. As a result of being in direct contact with the sun's heat, the evaporation of water on the earth; this

same vapour condensing and turning into cloud; the cloud so formed becoming enriched over some period; and, in the fruition of such enrichment, rain again falling drop by drop upon the earth — this cyclicity is to be seen. In this, it is ascertained that the meaningful thing is just this: that water on the earth be detained and kept spread over more area. By this alone can the human's future become secure.

Along with this, on paying further attention it becomes known that the grandeur of the biological order, the grandeur of the animal order and of the knowledge order, their workings, and the auspicious site of work-behaviour, stand evidenced only on the upper surface of the earth. These three orders cannot flourish anywhere inside the earth. Along with this it is also seen that celestial light is reflected (imaged) only in the upper part. On the basis of the earth being opaque, it is not possible for celestial light to be permeative through the earth. It is necessary for the human alone to pay attention to all these facts. Because it is the human alone who has interfered in the inner part of the earth; its result has already turned inauspicious. Its clarification has been done. The human wants only wellbeing (*shubh*). There is need to become adept in the formula and explanation of wellbeing. On the basis of such a formula and explanation of wellbeing, or the formula and explanation of universal wellbeing, one lives evidencing the coexistence method — that is, law, control, balance, justice, dharma, and, with truth, resolution, prosperity, fearlessness, coexistence. Universality is the formula and explanation of wellbeing. We have understood this matter well. We have explained it before: undividedness is the formula, universality is the explanation; its bearer-carrier is the human alone. This itself is the evidence of awakening, the grandeur of good fortune. This is also the human's desire; therefore, all improper, unnecessary, ruinous tendencies, work-behaviours, and configurations that have occurred through the human out of delusion — to correct these with awakening is itself the human's honour, and, together with it, good fortune.

3.8 State–Motion (स्थिति-गति)

[p. 84]

The human wants to be evidenced in state–motion with awakening. Such evidences are hoped for in relation both to one's own self and to the whole. First of all, this principle will have to be taken to heart: state and motion are indivisible. 'Being', 'remaining in motion' — this is its root evidence. Even an atom remains in motion on the basis of being. A planet-orb too remains in motion on the basis of being. The entire world of matter maintains motion in the form of formation and decomposition only on the basis of 'being'. All plants too, on the basis of being alone, remain in motion in the form of growth (*pushti*). The entire animal order too remains in motion on the basis of being. The human evidences motion only on the basis of being awakened. Thus, in existence in the form of coexistence, every thing that has attained eternal establishment is present in the form of state–motion. By this method the whole of state–motion is indivisible. Force in state, power in motion — or, state is seen as force and motion as power — and force and power are certainly indivisible.

This indivisibility of state–motion is also seen in the jeevan activities occurring in the human. In the human, state appears in the form of realisation (*anubhav*), motion in the form of evidence. The buddhi, together with the enlightenment (*bodh*) of reality, actuality, and verity, is itself the state, and resolve (*sankalp*), in the form of the tendency to display it, is itself the motion. Enlightenment itself is the manifestation of realisation and of evidence. Realisation–evidence (lived testimony) is enlightenment–acceptance, manifestation–information; such information has its purpose for the realisation of others. Direct recognition (*sakshatkar*) of justice, dharma, and truth, in the form of contemplating, is the state in the chitta, and its being pictured in the form of visualisation is the motion. The entire visualisation of the chitta’s workings becoming clear in the form of deliberation (*tulan*) — that is, in the form of justice, dharma, and truth — is the vritti’s innate state; the deliberation accomplished in the vritti being analysed by the analysis method and being communicated is the vritti’s innate thought–motion. In the clear or essential form of the analysis, value gets accepted. To taste this is itself the state of the mind (*mun*); being in motion in the form of carrying out the selection activity for its meaningfulness is surveyed in every human. In this manner it becomes clear that the human too is in state–motion in every way. Thus, after the human becomes endowed with understanding, being evidenced is natural. This means precisely: so long as we are not evidenced, the acquiring of knowledge, the acquiring of wisdom, and the acquiring of science in order to be evidenced is itself the meaning of education and instruction. For this, the coexistential education sequence is appropriate. Hence there is need to pay attention in order to be an understanding human.

[p. 85]

To understand coexistential thought — knowledge, wisdom, science — is itself understanding. Because, however much has been lived and understood according to idealism and materialism, no method of universal wellbeing could be propounded from it. It is necessary to underline this clearly. The source of universal wellbeing is coexistential knowledge, science in the form of thought, and wisdom alone. This can be understood very easily, and can also be made understood. We can let live, and we can also live; every one of us persons can be evidenced in the state–motion of understanding, and can incline other people toward being evidenced. This itself is the method of the dissemination of understanding: the whole of humankind being evidenced in state–motion. All the situations are clear in the form of the universal and the undivided-society relationship. Participating in all these steps is itself the meaning of evidence. Such evidences are projected in, from, and for the human by the realisation-based method. Such realisation-based evidences are universal; for this, to live and see is the only way.

The human wants to be adept in the discipline of science. In becoming adept, the experimental and practical hindrance so far has come down to just these points. First, no trace of the ultimate truth could be found; second, the root measure (*mool matra*), the source of energy, and the goal could not be ascertained; third — the study of the human could not take place; fourth — the purpose of existence could not become clear. In this manner, even after experimenting in science with such long and wide dedication, all those wishing to live clearly ended

up frustrated. On this issue it was first settled that whatever claims come before science by the materialist method or by the idealist method — that is, whatever question marks arise — the attempt be made to solve them on the basis of the economic, social, and political poles. But on this basis no logically consistent and purpose-consistent work-behaviour, orderliness, or tradition according to any meaningful view could be established. Compared with this, such a desire is being found in every man and woman who desires wellbeing — in other words, who desires universal wellbeing. On the other side, the matter of becoming frustrated has become clear. Even among those who become frustrated, many people must surely be desiring universal wellbeing. If one proceeds to reason consistently by the method of desiring wellbeing, universal wellbeing alone is the pole. Now here, taking the desire for universal wellbeing as the acceptance of all humankind, or the acceptance of the majority, this treatise has been carried forward in the sequence of thinking, understanding, and presenting evidences further.

Whatever methods have so far been called science — in them, the conception and evidence for clarifying the following points have been from their own standpoint. The standpoint of science is committed to struggle. On this basis, the whole of nature other than the human is [p. 86]

for the human, for the human's use. Among humans, only he is fit to use it who is the most powerful — that is, he who beats, plunders, murders, terrorises, and slaughters others. Here the further argument may arise: has science ever declared such a thing anywhere? The declaration of science is not in the form of a document. Those who have gone on living in the name of science — that is, who, citing science, have composed treatises in the form of their opinions — in them, mention of this kind is found.

In this, the main declaration — uncertainty, instability — becomes clear as a point from within it: science is independent in itself; the scientist is not. Confirmation of this matter is indeed found in scientific documents. Here this very question arises: is the responsibility of science the book's, or the human's? In this sequence, regarding the document that is in the form of the book: the belief has come to be established that, further on, whatever is evidenced by the instrument is the truth, even if it be not the ultimate truth. Its conclusion came out to be just this: the instrument became the principal evidence. By this method, responsibility, instead of being on the human, was thrust upon instruments. In this, the convenience for human thinking can only be this: not to generate the entanglements of reasoning. It is the human who will use reasoning. With instruments no reasoning is possible at all, because what an instrument does, it keeps doing again and again. Thus, repeating again and again was itself taken as the basis of trust, or the basis of assurance. Thus, according to the activities of science, the human is far from responsibilities. Whereas it is the human who makes the instruments.

In the situation of observation and testing we find that every human is a proponent of responsibility. Every human is a proponent of justice; every human is a proponent of orderliness. At the root of all these, every human is on the side of understanding.

Mention must certainly be made of this: that we humans, in the form of the definition of the human, are the ones who give concrete shape to ideas (*manakar* — the mind's forms), and we have remained incapable, by the prevalent education-method, of evidencing mental well-being. Mental wellbeing itself is the human's essentiality; it is in the sequence of evidencing this essentiality that we have already examined within ourselves and evidenced the fact of the human's being happy. This is successful by the coexistence method. In every discipline, we become happy only by living with resolution. The formula of living with resolution was found meaningful only with understanding. Understanding is accomplished with the coexistence-complete standpoint. In this sequence, we have already understood before that the eternal source of understanding is in three disciplines. It has already become evident from the study presented up to now that understanding does not get evidenced by the idealist method, by the materialist method, or by logical methods. By the proposed coexistential

[p. 87]

method alone, by the realisation-based method, every man and woman can evidence all-round resolution with humane conduct, in the form of understanding, honesty, responsibility, and participation. They can experience happiness for ever and ever within themselves, because being endowed with universal resolution is itself the very first rung of understanding. This is indeed present in every awakened human. For this very reason, the possibility of being happy for ever and ever also remains contained therein. On this very basis, the need to be evidenced persists. Thus, it became possible for every understanding human to be responsible and to be benevolent in, from, and for the tradition. The meaning of benevolence (*upkar*) too is clear. In the sense of awakening: to make understood what has been understood, to have done what one has done, to teach what one has learnt — all this being resolution-bringing, benevolence consequently becomes meaningful. In this manner it has become clear how the human can be benevolent. It has also become clear how all of us — those regarding themselves as understanding and those regarding themselves as ignorant — created problems. Along with this it has also become clear that the world of science, in its mentality and in its works of enlightening, in the course of arriving very far from responsibilities, tried to recognise the human as being like a machine, and in this failed utterly.

There is simply no thing that does not become clear by the coexistence method. The whole of things is worthy of being understood by the one who understands; it does get understood; it has also been understood. To make understood what has been understood is a self-inspired activity. Thus, the basis of the manifest and the unmanifest has become clear. The human was able to evidence, was able to make understood, what he wished — this itself is the evidence of being manifest. Along with this there is also living. What we kept regarding as understood but could not make understood — this itself was called the unmanifest. Whereas existence in the form of coexistence is eternally present and manifest; in it nothing at all is unmanifest.

Karm Darshan — Chapters 3.9–3.10

3.9 Quantity (मात्रा)

[p. 88]

Whatever substance exists in the form of a single unit — what is meant by substance is precisely the expression of actuality. Actuality, in every substance, is orderliness-with-inherence (*tva*). Actualities remain present, mutually with one another, in an indivisible form all the way from form, property, disposition, to dharma. That is, form, property, disposition, and dharma are found expressed in an indivisible form together with quantity. At the root of being expressed is the expression, communication, and manifestation of coexistence. It has already become clear that, in coexistence, every single unit is found submerged, saturated, and enclosed within the pervasive substance. It has also become clear that the pervasive substance is permeative and transparent throughout each and every single unit. It is precisely as a result of remaining saturated within the pervasive that each single unit is found to be endowed with energy and endowed with magnetic force.

Each and every atom alone is the root quantity. Such numerous atoms, in the form of molecules; numerous molecules, in the form of molecular composition; such compositions, in the form of matter and the prana-state — this too has already been made clear before. In every species, atoms constituted from two particles up to many particles have made their own respective forms of conduct clear.

That the atom is the root quantity has become clear for this reason: that the unit which comes to be defined is one that is, in itself, an orderliness, and participates in the overall orderliness. Even in units that are not themselves in orderliness, a tendency for participation in orderliness is nonetheless found to occur — as with an atomic particle, or a deluded human being. An atomic particle, in itself, is not able to evidence orderliness — that is, it is not able to express a determinate necessity — and therefore every atomic particle is propensive in the sense of participating in an atom and, as a result, evidencing orderliness. The evidence of this is that every atomic particle does become absorbed into one atom or another; or, more than one atomic particle, recognising one another, come to function in the form of an atom, and as a result determinate conduct alone comes to be known as orderliness. From this it becomes known that atomic particles recognise one another and carry each other out; determinate conduct in the atom is clear.

Just as an atomic particle does not exist in orderliness without recognising other particles, so too the human being cannot live in orderliness at all without recognising other human beings. There is one and only one thread for recognising the human being — human-ness. Human-ness is nothing but human consciousness, by which all humankind can be recognised in the form of the human being. Human-ness, in its own nature, is nothing but the nature of the definition of the human being. In the sense of mental well-being

[p. 89]

itself, it is by the coexistence-ist method, even through the discipline of science, that the thread-form of mental well-being comes to be analysed, determined, and elaborated. Such determination is necessary only in the sense of the human goal. In this same sequence we have already understood, by the coexistence-ist method, that it is indeed necessary for the human being to recognise his own necessity in a firm form. The certainty of this necessity — that is, the certainty of humanity-replete necessity — is found to occur in the form of evidencing human-ness as resolution, prosperity, fearlessness, and coexistence. This means precisely that we human beings are able to make humanity-replete conduct clear only in the process of evidencing the human goal. The determination of human necessity is indicative of knowing-believing. Knowing-believing alone is the conduct of being evidenced; this itself is the thread and the explanation.

It is natural that the principle of quantity too, at its root, remains animated by these very meanings. Therefore, as more than one particle gathers together and functions — that is, conducts itself — the many species of atoms remain recognisable on the basis of their conduct. The human being recognises this; this becomes the grand, dignified condition of the human being's own natural fitness. At the root of this remains simply the tinge of knowing and believing. In the same way, in the compositions constituted from prana-cells too, the composition of the prana-cells remains determinate. The evidence of this is precisely the composition of the plants of many species — in all of these, remaining animated from seed to tree, and from tree to seed — that is, impulses from one seed to the tree, and impulses from the tree to the seed, remain contained in that very seed-tree. In these two kinds of impulse together, the necessity of the trees of that species has been made clear. In this way we human beings recognise any substance in a firm form; the basis of this remains precisely firm necessity. In the same way, the human being has become assured about the conduct of the ant up to the elephant, of the dog up to the cat, and of the cow, the tiger, the hen, the insect, and so on. Along with these, the human being has also adopted the necessary method. This necessary method appears, by way of indirect statement, to have been accomplished all the way to the world other than the human. When, in that same sequence, human beings come to the position of recognising other human beings, we then feel doubtfulness — whether we are managing to recognise them or not. For this doubtfulness, disputes remain formed in human tradition by methods relating to caste, ideology, sect, position, and money. As a result, treachery, rebellion, exploitation, and war are found effective. What is meant by being effective is that these accidents keep on occurring.

Even if the human being were to consider himself as mere quantity, would the human being's necessity thereby become clear? Even on thinking of oneself as mere quantity, it still seems that we human beings have not been able to determine our own necessity, and it is for this very reason that necessity has remained uncertain,

[p. 90]

and even on the basis of necessity we have not been able to recognise the universality of orderliness, its poles. One pole of human-ness is precisely the human being's own necessity, which comes to be evidenced in behaviour, in the work of production, as participation in orderliness with resolution.

Human necessity is, in itself, entirely clear: resolution, prosperity, fearlessness, coexistence. The evidence of this is that human conduct in the form of value, character, and ethics becomes successful. This has been seen tested by experiment. This does not come to be evidenced by the idealist or the materialist method. Therefore it is precisely this — that is, by the coexistence-ist method — that the human goal and conduct become easy to study. To succeed at this universally, or to succeed and be so in all humankind, is itself the glory of awakened human tradition. In the form of evidencing value, character, and ethics, the human being does keep on doing something or other from within himself. Why should it not be thought that, in the sense of human necessity, all this be done? Any individual can make such a resolve. It is also to be seen that the necessity for such a resolve to occur is felt after a certain age. Most human beings, most predominantly from the age of 12–14 to around 20 years, retain, in the form of the most predominant mentality, the expectation that there be justice in society, orderliness favourable to all, and happiness for all. But, by getting attached to some faction or other, this mentality is gradually killed off — that is, these expectations get stunted. After this, what remains is that whichever sect or class-mentality people remain committed to, or continue to hold — that alone we take to be correct, take to be proper. As a result, we get weighed down into matters of treachery, rebellion, exploitation, and war in mutuality.

That all humankind, at some age, should wish well for the greatest number of people — that is, that all humankind should wish for universal wellbeing — for the confirmation of this, it is coexistence-ist study alone that has made this possibility accessible. At present, one and the same human being, up to a certain age, wishes for the happiness of all or of most people, and after a somewhat greater age is seen weighed down toward gathering convenience for his own family and himself. To establish balance between these, it is necessary, according to Madhyasth Darshan (coexistence-ism), to make available the education of value that is consciousness-development — that is, it is necessary to universalise coexistence-ist education. To bring all four states to a balanced point, the coexistence-ist method alone will have to be adopted.

[p. 91]

All substances, in their subtle form, in the form of the atom, are the root quantity. As composition, they are available to us in the form of large and small units, and available in the form of minerals. Together with these attainments, the thread of our future remains bound. Whatever conduct we have carried out today, whatever work-behaviour we have carried out,

whatever conduct in disorderliness we have carried out — the fruit and result of this, even if not today, will have to be undergone by us even after years. From this endeavour it also becomes understood that, in the present, we have to be understanding for ever and ever. To remain understanding, it is necessary also to remain diligent in order to keep the tradition of understanding intact. This itself is what is meant by the human being's state-motion.

State-motion, in every quantity, is a natural activity. It is only in the combined form of state and motion that every activity is recognised. The conduct of a substance is recognised; in motion, conduct remains as fruition in state. This itself is the form of the actual condition. The thread and the explanation of the actual condition remain contained in this very thing. For example, hardness in iron is a physical necessity. It is only in its state-motion that the evidence of this comes about. To make use of iron is precisely what is meant by its capacity for motion. It is only when the human being, bringing his own power and force to bear, tests iron, that trust in iron comes about. In this the human being has already succeeded considerably.

Testing and inspection have already been carried out with a great many substances. Certainty has been attained, and on the basis of this certainty, many technologies are seen to remain functional. It is out of the desire to participate in some one or other of these technologies that we ourselves undertake technical education. Meaningfulness is also seen in this. The evidence of this is that many people do participate in technology. Even while many people succeed in the discipline of technology, being evidenced in mental well-being has still not come about. In order to be evidenced in the discipline of mental well-being, it is recognising the human being that becomes the primary matter. Without recognising the human being, the evidence of mental well-being does not occur. Recognising the human being comes about only through living with resolution and prosperity, and through evidencing justice. Justice, in itself, is found to become clear in the forms of relational value, evaluation, and two-sided satiation.

Without oneself carrying out conduct replete with humaneness, recognising humane conduct in another human being simply does not come about. This can be tested in the following way. One person carries out humane conduct, and another also does so; if, in the mutuality of these two, work-behaviour is assessed, and experimental research is also assessed, then of humane conduct

[p. 92]

evaluation comes to be found in mutuality; it becomes clear that evaluation occurs only in mutuality. In this same sequence, further: one person carries out humane conduct, another does not; in that situation, the one who does has trust in himself, while the one who does not has no trust in himself. The third situation is just this: neither of the two carries out humane conduct; then, in the discourse of vices, the matter arises of agreeing on vices; in criminal acts, in criminal thoughts, a situation of partly agreeing and partly disagreeing arises; no conclusion emerges from examining things in this way.

From the above happenings we come to know that every awakened human being keeps his own identity intact only through conduct in the form of orderliness within himself. This itself

is the ascertainment of the actual condition. We have already carried out this study by the method of the ascertainment of actual conditions. The ascertainment of the material state, and the methods for the ascertainment of the prana state and the jeevan state, have already become trustworthy. Up to now the human being has trusted in these three states, and, on that very basis, has also attained success in his own manner. What is meant by his own manner is that he has attained success in the sense of the convenience of accumulation — even though not everyone has obtained the convenience of accumulation. In this way, it is only in the process of we human beings evidencing our own necessity in a firm form, by the method of maturity, that there is the possibility of reaching undivided society. It is only after the thread of undivided society becomes meaningful that universal orderliness comes to be explained. This alone will be the meaningful, effective form of wisdom and science. In this sequence, the matter for our attention is the study of the human being, human-ness, humanity-replete conduct, undivided society, and the thread and explanation of universal orderliness. In these studies, one principal matter is this: what is the purpose of every human being? The purpose of every human being is just this: firmness in conduct. After this, the purpose is evidence of conduct within orderliness. After this, the final height of purpose is participation in universal orderliness.

At present, while recognising everyone else, the human being is most backward in the discipline of recognising the human being. This deficiency can be made up through knowledge-, wisdom-, and science-replete work-behaviour. This means that, in the units of the three states, participation, together with their own inherence, in orderliness and in the overall orderliness, has already come to be evidenced. It is precisely as an outcome of this that the human being has succeeded in giving concrete form to ideas. Iron's remaining unfailing in its own orderliness; soil, stone, gem, metal — all remain unfailing, each in its own conduct. On this very basis the human being has been able to enrich, together with these, the technological system relating to his social ambitions, or production. If all these were to become mutually quarrelsome, given to disagreement, opposition, and rebellion, like the human being, what would happen then? If, in the same way,

[p. 93]

the rest of nature too were not to maintain stability and certainty in its conduct, what would happen? No human being would have the possibility of giving concrete form to ideas. It became a meaningful form for the human being that the three states, by the sequential method, each remain manifest in the form of determinate conduct according to their own actual condition. But the human being, in order to be meaningful while living together with the rest of nature, has simply not managed to evidence mental well-being. Without evidencing this, it is not at all possible for the human being to be complementary with all of non-human nature. Not only this — without the human being being complementary with the human being, being complementary with the rest of nature does not come about at all.

From the coexistence-ist viewpoint, the activity, process, and meaningfulness of science become assured, because, by the coexistence-ist method, the purpose of science is to determine the direction for the human goal to become meaningful. Since the human goal is resolution,

prosperity, fearlessness, and coexistence, it is precisely the determining of the direction, and of the methods of teaching, for this to become meaningful in all humankind that is the purpose of science and wisdom.

Science has its importance by way of this method of determining such a goal. By this method both the viewpoint and the work of wisdom and science became clear. This also makes clear the intent that, in favour of human conduct becoming determinate —

- science should become meaningful in the sense of wisdom;
- wisdom and science should become meaningful in the sense of knowledge;
- knowledge, science, and wisdom should become meaningful in the sense of coexistence;
- knowledge should come to be in the sense of coexistence.

This itself is the meaning of realisation-based coexistence-ist knowledge, science, and wisdom.

Quantity, in its root form, is recognised as a unit that is itself an orderliness, and that participates in orderliness. Such a unit begins in the form of the constitution of more than one particle, whose shape (outcome) is determinate. On the side of the determinacy of shape (outcome), a great many examples have already been presented. Now here it is necessary to become clear about form, property, disposition, and dharma. Every form is clear in the forms of shape, volume, and bulk. What is meant by shape is however it remains constituted, together with however much

[p. 94]

space it remains spread out over, and functions — that is, remains in state. As one might think about a tradition, into however much space it remains active. In the same way, further, the compositions constructed from numerous molecules, whether very large or small — the shape they remain formed in, however much space they occupy — it is on this basis that the recognition of form comes about. Of this, what shape is, how the shape is, is a matter of construction; the meaning of volume is enclosure (spread). What is meant by enclosure is remaining bounded on every side within the pervasive substance; by another method it is also in terms of length, breadth, and height. By these methods we are able to recognise shape; every such shape, or unit, remains reflected on every side. The unit remains reflected in the units situated on every side of it, which are illumined by it. In this way the method of mutual recognition remains formed. There is no need to construct the method of recognition. By this method, every substance remains reflected upon every other substance. Every substance is luminous.

On thinking by the above method, this question can arise: is light not needed in order to recognise one another? — as sunlight is available upon the earth. The answer to this is just this: whatever light we human beings recognise at present, it is only on the basis of recognising light through the eyes. Whereas every substance is indeed luminous. The reason for this is just this: in every atom, activity in the form of effort, motion, and outcome remains present. In the fruition of motion, sound, heat, electricity, and wave remain manifest. At the

root of activity, being endowed with energy and being endowed with magnetic force remain self-established. The glory of the unit endowed with these four kinds of force keeps itself illumined in the forms of existing-ness and luminousness — that is, they remain illumined. From this we come to understand that every substance is luminous. The testimony of luminousness has already become entirely clear as being, in the form of reflection, present on every side of the unit. That reflection alone is the basis for recognising one another — this fact has already become understood. For this: place any substance in any one room; if we sit down naturally on every side, that substance does indeed come within the sight of all of us. By another method: our eyes, according to the construction of the visual organ, cannot see anything in a dark room without more light. There is no motion at all in the reflection of substances placed in the room. This is understood by this method: owls, which are active by night, and animals with similar eyes, do indeed recognise the substances they need. Just as owls and bats do recognise fruits, and the deer recognises grass. Whereas the human being does not recognise. Merely from the human being's not recognising, the substance does not itself

[p. 95]

become an error in presenting itself, nor is it the case that there is no one else who recognises it either. It can be considered that the elephant, the ant, and the owl too do see it. By the method of investigation the conclusion emerges that each of their eyes remain formed according to their own respective necessities. In the same way the basis of the five sensations remains formed, because the arrangement for recognising something through the eye, something through the nose, something through the tongue, something through the skin, something through the ear, is found formed in the living human being. It can be thought that a similar arrangement will surely be present in all living creatures. Just as the frog's skin remains formed as it is, the feathers of many birds remain formed in different ways, and the cow's hide remains formed of its own kind — in all of these, tactility remains formed differently according to each one's respective necessity. In this way it remained natural for the tactility of the human body to remain distinct. We can accept, from bodily knowledge, that the composition of the human body can express all five kinds of sensation with excellence, and can communicate tendencies. This good fortune makes clear the sense of equality present in every kind of human body. By way of indirect statement, sensation is found to be present in all living beings. In this way it became clear what activity occurs, together with quantity, in the jeevan state and the knowledge state. Every composition is one quantity; in these quantities, diversity of form is a matter for study in the forms of shape and volume; diversity of property in the forms of motion, work, and tendency; diversity of disposition in being different across the four states; diversity of dharma in being distinct across all four states. This matter has already been made clear before as well. The material state is endowed with the dharma of existence, whose destruction is not possible. The prana state is endowed, together with existence, with the dharma of growth (*pushti*) — the evidence of this is the tradition of one seed transforming into many. It is by the logic of seed-and-tree alone that the whole of the prana state exists. The jeevan state, together with existence and growth, is endowed with

the dharma of hope. Every animal wants to live; to live means to express sensations. There is nothing more than this. In the knowledge state, the human being, together with existence and growth, is endowed with the dharma of happiness — this too has been made clear along with this. Resolution alone is the evidential form of happiness. All-round resolution is what the human being expresses in the process of evidencing his own understanding. This expression, communicated, reaches, in, from, and for every human being, unto study, comprehension, realisation, and evidence, and comes to be accepted. From this it also becomes known that the human being, in coexistence, expresses all-round resolution only by the realisation-based method, from which it is natural for the human family to be benefited. What is meant by the benefit of the human family is being within human awakened tradition, human universal orderliness, human undivided society, and, at the very least, human family orderliness. In family orderliness too, the human being, for the human being, or for the family,

[p. 96]

is also motivational, and by this method resolution remains bound up with benefit. Or, by the method of benefit, resolution remains bound up. In this way, in the human being, it is precisely understanding that is meant by seeing; understanding alone is seeing.

If human quantity — the human being — is taken to be one quantity, what the purpose of this is becomes understood in and of itself, in that situation. In the same way, animals too, on the basis of quantity, are found studied as being complementary to the human being, in the same sense as their being complementary to the plant order and the earth. It is found that, through the excreta and through the respiration of animals, complementariness to the earth and to the prana-state occurs, because, in this, fertility in the earth naturally increases. The animal order is understood to remove many diseases of the plant order. The evidence of this is that in forests where there are no animals, many diseases are found to occur among the trees and plants; in forests where many animals live, disease and affliction are found to be minimal. Any person can test this. In this same sequence, in the world of crops too, weeds, insects, and the coming-and-going of birds — especially the combination of honeybees — are found to be beneficial to all crops. Wherever there is a lack of all these, the crop diminishes, and there the insects that destroy crops increase, and new diseases keep getting prepared every year. For this very reason, however the earth is adorned, there is need to pay attention to it. This adornment has come about, in itself, only by the method of complementariness and usefulness; the evidence of this is that the prana state manifested only after the material state. Whatever species are contained within the prana state, all of them are found to be complementary to, and useful for, the material state. It has remained natural that the manifestation of the prana state occurred only after the material state, with all its various species of atoms, became accomplished on this earth. From this it becomes known that the material state is complementary to the prana state, and the prana state is complementary to the material state. The prana state is useful in this manner: that when the prana state comes to be constituted, fertility begins to increase in the earth. As fertility increases in the earth, so too does the advancement of the prana state proceed on this earth. What is meant by advancement is becoming advanced. Its form is such that, as fertility went on increasing, excellence in all the

shrubs and plants also went on increasing — which we can also call qualitative change (*gunatmak parivartan*) or development. The prana state is useful for the animal order, and the jeevan state is found to be complementary to the prana state. The usefulness of the prana state for the jeevan state is seen in this way: that it is in the prana state itself that the composition of the male cell and the female cell has already begun. In the jeevan state, the composition of the female and male body became clear as mutually distinct forms. What this means is that, in the prana state, cell-compositions, to whatever extent

[p. 97]

advanced, was not sufficient for the jeevan state, and there remained a need for further development, whatever the developmental sequence might be. From this the knowledge becomes clear that, in the sequence of the body-composition of animals, the distinctly clear form of male-female body-composition manifested itself. Food for animals has come to be accomplished from the prana state — in this manner complementariness and usefulness are entirely clear. In this way the material state, the prana state, and the jeevan state have proven to be mutually complementary and useful. It remained natural that the very first use of the prana state, in the body-composition of one or another animal tradition, emerged in the form of a festival in the prana-cells only as a further composition-method after the satiation of the prana-cells. On this very basis, in the bodies of some animals, the incorporation of the seven metals (elements) and the most enriched medhas-composition came to be accomplished. It was in such a body alone that the reproductive system, occurring through the conjunction of prana-cells, and the composition of the human body, remained a natural system. It is also clear that such body-composition has the possibility of being accomplished from various animal bodies in different environments — that is, in different geographical environments. The evidence of this is the existence, on this earth, of the body-composition of humans of many races. From this too it can be accepted that the fixed point (*dhruv bindu*) of one's own race is the accomplishment of the human body from a basic animal body. It is natural for some colour or other to accompany every race. In this way we human beings can make conjectures regarding the beginning of the human lineage. In this tradition, through which thousands, crores of generations have passed, it was indeed a necessity to find consolation by tracing root relations together with animals — for the sake of gaining recognition as a link in the developmental sequence. In this sequence, after the human being, in every geographical circumstance, descended with various kinds of racial colour, humans achieved success in the endeavour of securing their own tradition. Because the number of humans on this earth has already increased considerably, it is also to be observed that other animal traditions too remain secure in their own colour and form. On the basis of having the most developed body-composition, it is clear that the human being is the most useful, or entirely useful, for jeevan. It is precisely in the process of being evidenced that the human being is indeed desirous of giving a sharpened form to cognisance, or to cognisance-ness. It is by this very method that the human being's study coming to be evidenced in the forms of knowledge, wisdom, and science is an inevitable event. From this coexistence-ist viewpoint, being evidenced in knowledge-fullness, wisdom- and science-fullness, and, together with human-ness, in orderliness

and in the overall orderliness, remained both necessary and inevitable. In this same sequence, from the coexistence-ist viewpoint, it became possible for all the matters that the human being already wished to know, that had remained unknown, to be explained.

[p. 98]

By the above method it became clear that, of the whole of quantities found in the four states in existence, each single quantity is itself an orderliness together with its inherence, and is a participation in the overall orderliness. This study has been presented for the human being to be meaningful precisely in the sense of participation, together with human-ness, in orderliness and in the overall orderliness.

In the discipline of quantity, the study of form has already become clear for all four states, in relation to form, property, disposition, and dharma. Now it is necessary to become clear about property and disposition. Disposition is seen to be different across the four states. In the material state, disposition is seen in the form of the activity of combination-decomposition, or combination with one thing and decomposition from another. In the prana state, disposition is found in the forms of essentiality (*sarakta*) and destructiveness (*marakta*). Essentiality is in the sense of being abundant in oneself, and, secondly, in the sense of being useful for the animal order. Destructiveness means the activity of creating obstruction in making one's own seed-arrangement abundant, and the condition of being disease- and death-causing for the animal order. In the animal order, disposition has been recognised in the forms of the cruel and the non-cruel. Non-cruel means not killing any other living beings, not eating flesh, and continuing to live on plant foods. In this way both the cruel and the non-cruel become clear. In another language these are known as the carnivorous and the herbivorous; in a third language they can also be called the violent and the non-violent. The disposition of the knowledge state is found to be fortitude, valour, generosity, compassion, grace, and mercy. These themselves become clear as the human disposition. Human-opposing disposition is reckoned in the forms of baseness, wretchedness, and cruelty, together with covetousness of others' wealth, others' wife/husband, and inflicting pain on others. Those who remain in these tendencies are reckoned among the animal-human and the demon-human. Both of these are found to be human-opposing. There remains the possibility that those with human-opposing disposition may gradually be transformed into humane disposition. It is on this very basis that meaningful education is proposed — in other language, coexistence-ist education is proposed.

What is meant by fortitude is remaining entirely clear about, and evidenced in respect of, human justice. Study and tradition alone are the sole basis for becoming entirely clear. Tradition is the bearer and carrier of the work of study; study keeps on occurring in the present. What is meant by valour is precisely this: remaining committed in faith and in behaviour to justice oneself, and, while remaining evidenced, dedicating and surrendering one's own body, mind, and wealth so that justice becomes accessible to people. This too is found to become meaningful only by the method of education, and by the method of education for the populace. Generosity's

[p. 99]

meaning is precisely making use, by the method of usefulness, well-usefulness, and purposefulness, of the wealth that is body, mind, and money obtained from within oneself. What is meant by the method of usefulness is deploying it in bodily nourishment, protection, and the movement of society. What is meant by well-usefulness is dedicating and surrendering objects while participating in undivided society. What is meant by purposefulness is participating in universal orderliness, that too by the self-motivated, self-governing method.

What is meant by compassion is the activity of making substances available in accordance with worthiness (*patrata*). What is meant by grace is making worthiness available according to the substance available. This is found to occur in a situation of the absence of worthiness commensurate with the substance. What is meant by mercy is the activity of establishing both of these when neither substance nor worthiness is present. It is found that the human being, through compassion, grace, and mercy, comes to be made glorious in the forms of the human, the god-human, and the divine human. Such glory is found to be extremely useful for the country, the earth, and the human being.

The principle of quantity, in summary form, comes to be understood in this way: the substance existing in the form of each single unit is a unit-quantity. In the unit, form, property, disposition, and dharma remain present in an indivisible form. Each and every atom alone is the root quantity. That the root quantity is the atom has become clear for this reason: that the unit which comes to be defined is one that is itself an orderliness and participates in the overall orderliness. Where a unit exists but does not participate in orderliness, even in such units a tendency for participation in orderliness is nonetheless found — as with an atomic particle, or a deluded human being. A particle, in itself, is not able to evidence orderliness — that is, it is not able to express a determinate necessity — and therefore every atomic particle is propensive in the sense of participating in an atom and, as a result, evidencing orderliness. It is precisely determinate conduct that comes to be known as orderliness. From this it becomes known that atomic particles recognise one another and carry each other out. The human being's recognising the human being is, even now, a necessity. There is one and only one thread for recognising the human being — human-ness; it is necessary only in the sense of the human goal. The human goal is resolution, prosperity, fearlessness, coexistence. It is only in the process of evidencing the human goal that we are able to make humanity-replete conduct clear. The evidence of this is in the forms of value, character, and ethics. To succeed at this universally, or in all humankind — or for it to be so — is the glory of awakened human tradition. On this very basis, every human being becomes, in himself, an orderliness together with human-ness, and comes to participate in the overall

[p. 100]

orderliness — participates in undivided society, in universal orderliness. Therefore every unit in existence is known in the form of quantity; the human being too, by recognising human-ness, and evidencing the human goal through determinate humane conduct, is reckoned in the form of a quantity. In this way every atom, as the root quantity, and every composition, is reckoned as a quantity.

3.10 Property, Disposition, Dharma (गुण, स्वभाव, धर्म)

Property, in its own nature, is generative, degenerative, and mediating activity and tendencies. It is assessed on the basis of the fruit and outcome of these. Creative, combinative activity is indicated by the name generative tendency. Decomposition contrary to the work of manifestation, and destructive activity and tendency, is called degenerative. The tendency and activities carried out in maintaining whatever compositions are formed by whatever method of union-combination has been given the name mediating. Every activity does indeed manifest itself in the form of state and motion. It is natural for tendencies to be present at the root of every activity. Every propensity, in every unit, is dynamic and manifest on the basis of mutual recognition. This can be recognised in every state, in every category, in every actual condition. In every unit there is a tendency to recognise. On the basis of recognising and carrying out, propensity, development progression, development, the awakening sequence, and, on the basis of knowing, the occurrence of awakening, are found to come about. On this very basis, every unit's determinate necessity becomes clear in the form of inherence (*tva*). It is natural for necessity to become clear on the basis of propensity alone. In this way necessary propensity, necessary recognition — in this sequence mutual recognition occurs. Recognition occurs only in the sequence of orderliness together with inherence. In this sequence of mutual recognition of one another, becoming free from mystery is found to occur. Regarding these units, nothing remains by the name of the unknown. In the time of study, doubt can arise on this issue: to what extent should each and every single thing be tested? For example, how long should we keep testing the sea's water drop by drop?

How long should we keep testing atom after atom? In the same way, how long should we keep testing unit after unit of the prana state, the jeevan state, the knowledge state? Will one ever get to the far shore by this method? In answer to this, these facts have already been understood in this way: that every actual condition, state, and category is linked one to another like a staircase. Just as, in the material state's developmental sequence, passing through many actual conditions, elaborating form, property, disposition, and dharma, orderliness has come to be accomplished for physical substances from the very smallest to the very largest. Namely: shape, volume, and bulk, for form; generative, degenerative, and mediating, for property; combination-decomposition,

[p. 101]

for disposition; and existence, for dharma — we have already understood these. From this it becomes known that merely from testing one drop of the ocean we come to understand the water of the entire ocean. It is in this very way that the method of study is able to become meaningful.

By the above method, the study of the prana state too has already been understood: namely, shape, volume, and bulk, for form; generative, degenerative, and mediating, for property; essential and destructive, for disposition; and, together with existence, growth, for dharma. Beyond this, in the jeevan state, this has been evidenced in some animals as jeevan and body being in a combined form. In the elaboration of this: the presence of jeevan is evidenced in

those animals endowed with a body composed of the seven metals (elements), an enriched medhas-system, and the capacity to receive the human being's directive signals. In such animals, jeevan too has shape, volume, and bulk; the body too has these — however exceedingly subtle jeevan may be. In jeevan too, the generative, degenerative, and mediating property remains at work. In the human being, jeevan predominates. For this very reason, the body's generative, degenerative, and mediating property becomes secondary. In animals, disposition and dharma are in a combined form. Cruelty and non-cruelty come to be made clear in the combined form of body and jeevan. The hope of living, too — dharma — becomes clear in combined form. The whole of the animal order is explained by the hereditary method. In the same way, further, the elaboration of the human being's generative, degenerative, and mediating properties too becomes possible. In the human being too, property is most predominantly on the side of the mediating, which is expressed in the form of one's own glory. So long as the human being remains deluded, he regards the being of the self as paramount, and regards others as secondary. It is precisely the manifestation of this very tendency that has, from the distant past, become clear in the forms of treachery, rebellion, exploitation, and war. In this too, it is only the acceptance of the glory of the self that remains. The glory of the self is held to be good. Only with awakening does one come to understand the fact of the glory of the self existing together with the good of all; through delusion one remains unaware of this. When faith comes to be placed in this, one becomes awakened, and then one becomes free from degenerative properties. So long as one is not free from degenerative properties, frustration, despair, and torment remain in effect. This itself is what is called suffering in human tradition. The awakened human being's property is found to be, for ever and ever, mediating. Its universal form is: keeping awakened tradition intact, keeping universal orderliness intact, and, through study, keeping the thread of undivided society evidenced. This becomes manifest in the form of keeping justice evidenced within the family. In studying all these facts, an entirely clear outlook of goodness, resolution, and truth becomes evidenced for the whole of humankind. This alone is what is necessary. It is by this very traditional method that the whole of study becomes intelligible. It is through humane properties alone that the human being's fundamental distinctiveness comes to be mutually understood. In the same way, the units present in every state, in every category, keep on being evidenced in expressed form together with their respective property, disposition, and dharma-form

[p. 102]

itself. Among these, in every state and category other than the human being, every unit is indeed itself an orderliness together with its inherence. The human being too, being a unit, has need to become awakened up to the point where control in sensitivity is evidenced through cognisance. What is meant by the human being is precisely this: knowing, believing, recognising, and carrying out the material-conscious (*jad-chaitanya*) nature situated in the whole of the categories and states within coexistence. By this method, wholeness and universality in the human being, communality in animals, genus-ness and species-ness in plants, and, in the material state, numerous actual conditions according to the numerical differences of particles in the developmental sequence, are found to be evidenced. Even while there is diversity

in existence, the arrangement of quantity, through the differences of these states and categories, for recognising the human family, is a matter for study through the explanation of the thread of coexistence.

Karm Darshan — Chapters 3.11–3.12

(Working English Translation)

3.11 Force–Power (State–Motion) (बल-शक्ति (स्थिति-गति))

[p. 102]

We humans have, from the past, been making a great many conjectures about force (*bal*) and power (*shakti*). After the arrival of the age of modern science, experiments were made to draw further conclusions about power. That no complete conclusion has yet emerged from the discipline of science, and that nothing has emerged for humanness, is a point worth considering. In this context, through the discipline of science there has been an attempt to recognize pressure as force, and to recognize motion, wave, and flow as power. In this, many examples were presented — in the form of electric wave and magnetic force, likewise in the form of sound wave and pressure, in the form of the wave and pressure that occur in flow — in these various ways the attempt was made to impart study. In all of these it was found that the fact of mediation (*madhyasthiyakaran*) occurring in all of them has been denied. All these studies are based only on excited motion. When there is natural-state motion, where do force and power go — this question does indeed arise.

On this issue, from the viewpoint of Madhyasth Darshan it comes to be known that force is manifest in state, power in motion. This means that in the course of evidencing effect upon another, the introduction and recognition of power in the form of mechanical process occurs. It comes to be recognized on the basis of there being states. Many methods for testing this fact or principle are at hand (*samicheen*) before the human. ‘At hand’ means being nearby, being available. For example a stone: we go to lift it, we lift it; then whatever apprehension arises of the conjunction of the stone and ourselves, whatever comes into understanding, that is called weight. This weight, of its own

[p. 103]

accord, is found in the meaning of evidencing the formula (*sutra*) of coexistence with the earth. This very thing — the situation of the experience of this kind of weight occurring in every human — is clear. Take an empty pot: fill it with water, or fill it with soil, or fill it with potatoes or grain, and then lift it. How it feels upon lifting — that has been called weight. Every human, on the basis of being in himself one who gives concrete form to ideas (*man-akar*), and on the basis of being imaginative and free in action, thought about how weight

might be measured or weighed, and found the answer to it. The method of weighing was settled. The method of measuring was settled. Instruments capable of weighing and measuring things bigger and bigger than that — the loads of trucks and trains and so on — were made. Every person sees this every day. The entire phenomenon of weight is the arrangement (*vinyas*) that occurs in the course of evidencing coexistence with the earth; it is a principle. In this way weight is found to be animated by coexistence. Every unit, endowed with force in state, evidences and displays power in motion.

In this sequence it comes into understanding that every object maintains its own orderliness within a definite good distance. For example, in one atom more than one atomic particle, remaining at a definite distance, manifests orderliness with inherence (*tva*) in the form of conduct, of which the human is the seer. If, within such a definite good distance, the distance increases, then the mediating activity working in the atom in the form of the nucleus (*madhyansh*) applies its force and calls the particles near. If an atomic particle begins to come close to the nucleus active at the centre, then too the nucleus, applying its force, fixes the particle at the good distance. This is the controlling activity that takes place in the atom. By these very activities, control over mutual distance remains. When atoms are in the form of molecules, it is on the basis of the nucleus that mutual attraction-force is exercised, on the basis of endowment with magnetic force. As a result, one atom joining with another atom is called a molecule, together with molecular bond. It is natural for such molecules to remain endowed with weight. Because of this very weight, the propensity remains for one molecule to join with another molecule while remaining within a definite good distance. From such propensities, atoms, molecules, and large material objects formed of molecules — bodies (*pind*) — stand presented before the human, such as this earth. All objects joined to the earth, together with this earth, up to the earth's atmosphere, evidence coexistence — solid with solid, liquid with liquid, rarefied with rarefied. The arrangements which the earth and the objects that are limbs of the earth make for this, we name falling from above, running, flying, and so on. From above, only all those things fall down which are in the form of solid and liquid.

[p. 104]

The arrangement that a liquid object makes in its eagerness to evidence coexistence with liquid is called rain or flow. In the same way, the solid object that falls from above — that is the arrangement occurring with the earth, which happens in the effect of that object's evidencing coexistence with the earth. To this very arrangement the name of gravitation has been given. In reality this is nothing but the arrangement of a solid object's evidencing coexistence with a solid object. This is the respectful acceptance. In gravitation, the notion of small and big keeps running. In the form of coexistence it has been seen that each one, together with its environment, is complete. In this there simply is no small or big. This is confirmed by the fact that each one is orderliness together with its inherence. Both these principles are seen being fulfilled in the combined outcome of natural-state motion and definite conduct. In this sequence, each object being a constituent limb of this earth, honouring coexistence with the earth is, as a result, a natural propensity. The arrangement of this propensity is found to re-

main bounded up to the atmosphere of this earth. This earth too, together with its environment, is complete. However many limbs and organs are contained in the completeness, all these are found to remain bounded with the complete. 'Bounded' means evidencing a definite intent through a definite arrangement. Such definite intent is precisely the evidencing of coexistence — solid with solid, liquid with liquid, rarefied with rarefied. Whatever activity occurs in the course of evidencing coexistence, we call it arrangement. Its fruition is nothing but the evidence of coexistence. By this method the understanding that coexistence itself is existence becomes complete.

In relativity there is apprehension of small and big. Completeness slips out of sight. Only in completeness can each one be respected, be evaluated. It is the human alone who recognizes such evaluation and the standing of respect. When the human evidences each one in coexistence together with completeness, in such a situation it is found natural for the human to give attention toward his own completeness. Contrary to this, by the relative method attention goes toward small and big. Considering oneself big becomes a necessity. To keep that intact, keeping the other small also becomes a necessity. In this sequence treachery, revolt, exploitation, starvation, bombardment — all these deeds get done. When there is dialogue about them, their impropriety is accepted. In this manner the human becomes self-contradictory. Such a situation we address in the language of 'belonging neither to home nor to shore'. From this very thing indeterminism gets prepared. As a result the human falls prey to every kind of frustration or

[p. 105]

excitation. He moves away from natural-state motion. As a result, asociality and disorder come to hand. Unanticipated events in the form of disorder take place. This has proved entirely unnecessary for the human race. Therefore, as its alternative, it became necessary to be endowed with natural-state motion, state, and — along with certainty — hopefulness with definite plan, and evidence. This, by the method of coexistence, is at hand for all humankind.

The main point: coexistence being evidenced is itself the formula. It is natural that along with every work-arrangement, propensity, effort, activity, behaviour, fruit and result, coexistence be evaluated. The one who evaluates is the human alone.

There has been a long wait for the human to be evidenced by the coexistential or truth method. This waiting has been within the human himself. For this to be meaningful, the study of the coexistential activity-system was found sufficient for the human to be evidenced in behaviour together with humanness. Therefore its unveiling remained necessary. Coexistence alone is the ultimate truth.

State-motion, in its own form, is the combined form of pressure and flow. In some examples, while pressure remains, there is no flow — such as a stone upon the earth; in a pond upon the earth, no flow is visible in the water. In a river upon the earth, flow is visible. In the flow of water, pressure is quite clear. Pressure does remain. The flow of water is toward the slope, the slope ultimately joining up to the sea. Hence all rivers' water reaching the sea has become quite clear, whether by the natural method or by the method of destiny (*niyati*). Every pressure and flow of water can change into another kind of flow and pressure. Of these, pressure

itself is the principal cause of change. For instance, water's steam, upon definite pressure, becomes capable of operating definite kinds of machines, in whose fruition magnetic electricity is obtained. Of this, it has become clear that magnetism is in the form of pressure and electric wave is in the form of flow. From this it comes to be known that any force can become the agent of another kind of force and flow. By this same method, heating — that is, burning — oily substances to operate certain machines has become readily available in the human tradition. Such machines too are seen doing many kinds of work — seen, for instance, in the form of machines that move on the earth, in water, and in the air. By such oil-combustion processes, machines that generate electricity are operated. As a result there is electromagnetic flow and pressure. Likewise, from radiant (radioactive) materials as well, through the heat-emergence process, electricity-transmitting machines

[p. 106]

being operated too is something the human has practised. Their discharge — that is, the discharge or residue of minerals, coal, oil, and radiant materials — has become the cause of pollution. On this issue we have already made study earlier. In the context of its alternative too, attention has been drawn, by way of proposal, toward the flow-force of water. Along with this, attention also needs to go toward wind and ocean waves. The human's attention going toward the sun's heat as well — there is need to be encouraged in the course of obtaining magnetic electric current. Only then is it possible for the human to gain release from the polluting tradition of great crime — anti-destiny, anti-development, anti-awakening, anti-human, opposed to the earth's environment. On examining state-motion by the existence method it comes to be known (examining means ascertaining by way of testing, observing, surveying) that all units keep displaying and expressing force in state, power in motion. Such a situation is found equally in all units, from the smallest of the small to the biggest of the big. That a unit endowed with state-motion is in the form of orderliness and participation in orderliness has become clear before. **Endowment with force in state means the evidence of orderliness in oneself; power in motion means participation in the overall orderliness.** Fundamentally, it should be known that every unit, as a result of remaining saturated in the pervasive reality, is endowed with energy, endowed with force. At the root of every unit is the atom itself. It is quite clear that the atom itself works in the form of physical, chemical, and jeevan activity. Jeevan atoms remain free from molecular bond and weight bond, and, owing to delusion, remain joined with the bonds of hope, thought, and desire. All other atoms that participate in physico-chemical activity remain joined with molecular bond and weight bond. It is by virtue of such molecular bond and weight bond that being formed as small structures and large structures is found. The smallest structure is the atom itself. Atoms alone manifest grandeur in the form of molecules and molecule-formed structures. The form of such grandeur remains animated by the formula of coexistence alone. For instance, there being more than one particle in one atom, more than one atom in one molecule, more than one molecule in a molecular structure — all these are in themselves evidences that remain animated by the formula of coexistence. Among structures there are only physical structure and chemical structure. In these structures, being complementary and use-

ful for one another has become quite clear. In molecules of all these species, the expression of both state and motion is continuously present. It is never going to stop. From ever and ever these activities and expressions are present indeed. That is why the human stands presented as a unit fit to study all these. That is why the human himself has also to evidence orderliness in state and, in motion, participation in the overall orderliness. Only then is the evidence of mental

[p. 107]

wellbeing (*manah svasthata*) presented in tradition. Without mental wellbeing, all-round resolution in the human is simply not possible. Therefore mental wellbeing is for the human an utterly essential or supremely necessary attainment.

In this same sequence it is natural for the human, on the basis of understanding, to be glorified in himself in the formula of mental wellbeing in the form of all-round resolution. Such grandeur alone — that is, endowment with resolution alone — becomes able, or becomes successful, in evidencing prosperity, fearlessness, coexistence. This very success is the succour and life-breath (*tran* and *pran*) in, from, and for the human tradition. *Tran* means state; *pran* means motion. Being inspiration in motion, orderliness being evidenced in the environment or in the sphere of effect, and in state oneself being orderliness — this is the meaningful form of grandeur. For maintaining such grandeur there is indeed a hopeful propensity in the human. In the same way, in the atom, force in state and power in motion — that is, being endowed with a sphere of effect — is found. The remaining-secure of this mutual sphere of effect is itself the good distance in mutuality. Every unit endowed with such effects is successful in maintaining its own originality in mutuality; the name of this very thing is control.

Good distance in mutuality became clear in this way: that in mutuality the sphere of effect of each other should remain formed, remain secure. This sphere of effect is found to be only in the pervasive reality. State too, and shape, volume, mass also are found to be only in the pervasive reality. These shapes are found to be only together with activity. In every atom, activity is in the form of effort (*śram*), motion, result. **Effort is in itself the grandeur of the existent-state; motion is in itself the grandeur of spreading effect; result is found to be the grandeur of a different existent-state. In this way every result is arrayed in a quantitative and qualitative chain.** Within this, result is found in the form of fixed (*dhruva*) and long-enduring result. These become clear chiefly in the reckoning of the stability and instability of existent-states. Each existent-state, on the basis of being threaded by the formula of coexistence, remains meaningful in the meaning of complementariness and of usefulness-complementariness. In this way the meaningfulness of all things comes into understanding. Even one molecule has just such a history: one molecule with another molecule also — maintaining the field control related to the atom's sphere of effect — join with one another and become a body. In this the human has no contribution. All these activities, by the method of complementariness and usefulness, keep evidencing meaningfulness right up to awakening and its continuity. All the stages remain joined with one another. For instance, without keeping physical activity apart from chemical activity, chemical activity from the activity of living beings, and physico-chemical activity

[p. 108]

apart from the activity of the human, no work or behaviour is accomplished, nor can it be accomplished. All these remain inseparably joined with the human. They keep honouring their bounds indeed. For honouring the bounds with these, the human needs to be informed.

While the entire other-than-human nature is useful for the human, the human's remaining deprived of being complementary to other-than-human nature has itself been the basis of all problem-creating propensities. Because of this, whatever attainments occurred by the sequential method in giving concrete form to ideas — the road to their use and good use also fell into obstruction for this very reason: that the part of mental wellbeing remained neglected in itself. That is why, in this present, the being extremely necessary of mental wellbeing comes into understanding. Only by the coexistence method is mental wellbeing found to be attainable by all; this very possibility of all-good is quite clear. Only after endowment with resolution in himself does the human become capable of evidencing mental wellbeing. The plenitude of understanding itself is the form of mental wellbeing. Understanding is the spontaneous acceptance of coexistence. In this way, complete knowledge is in the form of acceptance. The right of acceptance and non-acceptance is indeed vested in every human.

The grandeur of state-motion is found to be in the earth, the solar system (*saar vyuh*), many solar systems, the galaxy, all galaxies. The evidence of this is that everything from the atom up to the earth becomes attainable by study, up to each being evidenced in its own state-motion. Up to this point study is readily available to every human. Thereafter there is acceptance of the state-motion of such planetary globes. In the same way the galaxy too, on the basis of being the activity of many solar systems, receives acceptance of state-motion. Together with this remains the acceptance of the pervasive reality. Hence, out of the vastness of acceptance, studying one's own necessities in the form of evidences is one necessity of the human. The provision for study occurring on the basis of acceptance depends according to the human's necessity. The vastness of knowing and believing we have already accepted in relation to the pervasive and the infinite. On the basis of knowing and believing about the pervasive and the infinite, from the study of any one locale, from the study of one unit, being assured about the form, property, intrinsic-nature, and dharma of all such units has become clear. This too has become clear: from testing one drop of the sea's water we accept what the water of the whole sea is like. But who stands ready to measure how much there is? We measure according to our necessity. The human's necessity too is limited. From examining the activity of measuring it comes to be known that this

[p. 109]

is only adding and subtracting; in measuring only 1, 2, 3 are applied. In weighing too. Likewise subtracting also arises: on one side we add, on one side it also decreases. From bringing together both adding and subtracting, only the existent-state comes to hand. As it is, as much as it is — this alone is the existent-state. Such an existent-state is neither more nor less, neither decreases nor increases. From this situation, existence neither decreases nor increases. By this method it becomes clear that the limits of our testing depend on our own necessity. In the course of adding and subtracting, the human has already accepted the mean-

ings in the form of minus infinity and plus infinity. In this way, in existence, the imagination or acceptance of the infinite has been accepted in the human tradition in the form of being unable, to some extent, to enumerate. Until now the apprehension of the pervasive reality has been uncurrent. After apprehension of the pervasive reality occurs, the answer was obtained as to how infinite objects are. Hence study in the form of understanding — the meaning of the infinite being inseparable in the pervasive — was found to be the basis of there being all-round resolution. In this sequence every unit is present with its state and motion. ‘The present’ (*vartaman*) means to keep on being current. To keep on being current means to remain active. To remain active means conduct remaining clear. Conduct remaining clear means orderliness with inherence in state, and participation in the overall orderliness in motion. This earth comes into understanding as participating in one solar system — the group of all planetary globes joined with the sun. All planetary globes are unceasingly at work each in its own state-motion. Without interference with one another, all, recognizing one another, are performing definite conduct and participating in the orderliness of the solar system.

That is why state indeed is, and motion also is. On this very basis it is natural that study concerning the earth’s state-motion also comes into our understanding. In this sequence, one solar system, making its work-arrangement with many solar systems at a definite good distance, displays the grandeur of solar-system inherence. To such numerous solar systems, or planet-arrays, scientists nowadays have given the name galaxy. Galaxies too are found to be many. All these, remaining at a good distance in mutuality, participate in maintaining the larger orderliness.

3.12 Projection–Reflection (परावर्तन-प्रत्यावर्तन)

On the issue of state-motion and force-power, the matter has already become clear with units from the smallest of the small to the biggest of the big, and that too in all planes (*pad*) and stages. Now we give attention to knowledge, thought, decision, evidence, fruit, result related to projection-reflection, upon knowledge being the witness.

[p. 110]

It is only in the meaning of a destination (*gamyasthali*) that the human wants to accomplish all his activities. As the human begins to walk, his destination needs to be before him. If there be no destination and only walking — what shall we call such a human? Every human can think about this. Likewise an ant too, an elephant too, animals and birds too, living creatures too — however many are in movement, their destination remains joined with each of them. The evidence of this is just that all, moving, keep reaching some definite place. Even the crocodiles that swim in water are, while swimming, at a definite, determined place. In this way some things are such as occur at every site of the earth. Some occur here and there. Some occur in a very small place. For instance, air is on all sides of the earth; the sun’s light is on one side, is not on one side; a river flows far and wide; a mountain appears in one place only. Just as shrubs and plants stay in one place only. In this same earth the human also lives, the bird also lives. Some years ago the human used to think that only birds go far and far; that has

changed, and now the human too roams the whole earth. Even while roaming, he is in some place, some location, indeed. Being (somewhere) remains inevitable indeed. This is a fact joined with state-motion. Without state there is no motion. This principle — motion is evidenced only along with a positive state. The human's state-motion is quite clear. While going from one place to another, the human's being, and relocation too, is visible. Along with this, the activity of projection-reflection also keeps being carried out.

Such projection-reflection we find to be in ourselves in the form of recognizing and causing recognition, as understanding; in the form of understanding, as learning; in the form of learning. Of this, the part that is understanding and making understood — in this alone projection-reflection becomes quite clear. By the reflection method we understand; by the method of making understood we are projected. However many activities there are for the human, they are by the distinctions of bodily, verbal, mental; done (*krit*), caused-to-be-done (*karit*), consented-to (*anumodit*). At the root of all these is projection; at the root of projection, reflection; in the grandeur of reflection, the activity of projection is carried out by the interwoven method. The meaningfulness of projection has been able to become satisfactory only when there is a human desirous of understanding. Only with such a human is the activity of projection — that is, the activity of making the understood understood — seen becoming meaningful. In the meaningfulness of projection it is necessary to be certain of this much: that projection be consistent with sequence, work, behaviour, fruit, purpose. It is found meaningful on the basis of production in work, on the basis of justice in behaviour, on the basis of human-aspiration in fruition, and, in purpose,

[p. 111]

on the basis of the jeevan goal. The acceptance that these — that is, production, justice, human-aspiration, jeevan-aspiration — become meaningful is spontaneous in every human. This point has become clear earlier.

Every human becoming understanding-endowed is an ordinary event, a common event, the most desired event. In the fruition of becoming understanding-endowed alone, all the other links join of themselves. It is necessary that, together with understanding, fruit-result become the source of satisfaction. Fruit-result is from human-aspiration being meaningful; the evidence of understanding too is from human-aspiration being meaningful; the meaningfulness of the human's entire work-behaviour too is human-aspiration being meaningful. The human's entire orderliness-process too is from human-aspiration being meaningful. If the meaningfulness of humane orderliness, humane education, and the human's thinking and thought is anything, it is only from human-aspiration being fulfilled. In this the main point is just this — that is, the main point of saying all this is just this: that from human-aspiration being fulfilled, jeevan-aspiration is fulfilled as a matter of course.

In projection, mention of this matter has already come: making the understood understood, teaching the learnt, getting the done done. If there is anything apart from this, it is consent (*anumodan*); consent too is found meaningful in these three meanings. In this manner the human is projected by the done, caused-to-be-done, consented-to method. The human being projected means: endowment with knowledge, wisdom, science alone is the human's root,

fundamental form. It is this that gets projected. Being projected means being evidenced by the above-said done, caused-to-be-done, consented-to methods alone. It is in such a sequence of projection that the human's evaluation comes about in undivided society, in universal system. In the discipline of undivided society, the recognition of human necessities comes about, or formula-orderliness comes about. By a third method, meaning-explanation comes about. The matter of the human, in the meaning of human necessity, from family orderliness to universal system, has become clear before. Meaning in the form of the human gets evidenced in this very sequence, becomes meaningful. For this very thing, complete knowledge, wisdom, science reaches from formula up to explanation. Of this, the seed in the form of coexistence appears being fulfilled in the form of aspiration, in the form of the knowledge-wisdom-science formula, and in the form of the explanation of work-behaviour and orderliness. This itself is the evidence of the awakened human tradition. Hence the human's spontaneous awakened propensity has become quite clear. Making this clear is itself evidence; however many work-behaviours one will do for evidence, these are all projection. The goal-fulfilment of projection gets evidenced, the intent-fulfilment gets completed. The all-good, beautiful, resolution-filled expectation becomes meaningful.

[p. 112]

To be happy is the intent. The human goal is resolution, prosperity, fearlessness — evidence lived in coexistence. The expectation is universality and undividedness themselves. Intent, goal, expectation become meaningful in themselves by the complementary method. When the goal is fulfilled, it is experienced: resolution in the form of happiness; resolution, prosperity in the form of peace; resolution, prosperity, fearlessness in the form of contentment; and resolution, prosperity, fearlessness, coexistence in the form of bliss. In this sequence, realisation (*anubhav*) in coexistence, realisation in undivided society and universal system, the realisation of freedom in production more than necessity, the realisation of resolution in every activity — this being renowned in the form of happiness, peace, contentment, bliss has been seen. Every person can test this on the touchstone of his own realisation. Only after living this have we verified the fruit-result. Satisfaction lies only in universalizing it among people.

For every person, by the realisation-oriented method — with study, research, testing, observation — evidencing human-aspirations comes about through realisation and, in projection, through the realisation-based system. In this way, living in the meaning of human-aspiration comes about by study, enlightenment (*bodh*), the realisation-based method, together with the realisation-based system. This itself is the root aim of study. Only in the sequence of increase in the number of persons living by the realisation-based method does the evidence of undivided society, universal system occur; sequentially, evidence coming about in resolution, prosperity, fearlessness, coexistence; the recognition of every awakened person becomes possible. Not only this — every man and woman does indeed want to become awakened; that is why universalizing among people the education fit for becoming awakened is the one and only measure. In humane education, all issues necessary in, from, and for the human are objects for study.

In this manner the human tradition does remain projected in the form of becoming successively more awakened. In reflection it does remain drenched in happiness, peace, contentment, bliss. Human-aspiration does get evidenced in itself by the work-behaviour-orderliness method. This alone is what living means. That is, work, goal, and purpose being evidence, and their continuity remaining — this alone is what living means.

From within the human race, knowledge, science, wisdom is evidenced. This alone is the form of undisputed innateness (*svatva*). In the projection of such innateness, on the basis of the assessment and acceptance of meaningfulness alone, assessment keeps forming in innateness; being evidenced from within ourselves toward continuous excellence does keep coming about. Once evidenced, a chain of excellence forms in the evidence method. This becomes the formula of firmness in reflection. In the human, only by the evidence method does meaningful capital, by the reflection method, keep growing continuously sharper and increasing

[p. 113]

indeed. Increase means: today we were evidenced in one issue, tomorrow in two issues, the day after the acceptance of being evidenced in three issues keeps getting included. This reflection activity is from remaining included in enlightenment and realisation — that is, it lies in acceptance remaining; this itself again remains the capital for projection. Such realisation alone remains established in enlightenment in the form of resolution. As a result, in projection we are able to evidence resolution. By this method, the projection activity being a constant source for realisation becomes clear by the reflection method. For evidencing awakening, this alone is the formula and explanation. Every reflection is a realisation-formula. Every projection is the explanation of the realisation-formula. **By this method the evidence of the human's form is evidenced in reflection in the form of knowledge, science, wisdom; in projection in the form of participation in work, behaviour, orderliness.** This itself is the awakened tradition. To maintain this from generation to generation is every human's duty and obligation.

Considerable study has become possible concerning the projection-reflection activity. In this very sequence, in tradition, consciousness-development value education-sanskara is an interwoven activity. Teaching is found to occur by the projection method, study by the reflection method. It is quite clear that teaching is a heard articulation (*shruti*) or language. The meaning of language — that it is reality (*vastu*) in existence — has become quite clear; enlightenment of the reality in existence, in the form of the meaning of language, is itself the root intent of study. This itself is the reflection activity. In coexistence, the enlightenment of every reality is able to be projected by the realisation-based method. In this method it became clear that the work of study occurs by the realisation-oriented procedure. This itself is the glory of reflection, or its attainment. By this method, projection is the teaching activity. Enlightenment of meaning occurring and realisation occurring are the fruition of study. Study up to enlightenment of meaning is the priceless fruit of realisation and reflection. The reflecting of enlightenment of meaning into the meaning of realisation is a natural activity. Because every meaning has its reality-enlightenment in existence. Deprived of the light of the

glory of realisation, enlightenment of reality in study simply does not occur. Even until now, whatever reality-enlightenments have occurred, all these have been evidenced in realisation itself and presented for study.

The human's study in the form of reality-enlightenment has not been able to become possible. Because the human's completeness is not within the chemical-physical limit — or, on the basis that the glory of chemical-physical things remains limited only to the body — the complete study of the human did not become possible according to materialism. Every human exists only in the combined form of jeevan and body, and is present in the form of tradition. For tradition, the body is one principal basis. The very meaning of tradition has been generation to generation, or lineage tradition. Body tradition is limited only as the basis of formation and de-formation. Whereas in the human tradition, jeevan and

[p. 114]

body evidence a combined superior status. That is, it makes clear glories greater than the body. Where there is body and jeevan is not, in such a situation there is no human. Therefore in the designation 'human' there is acceptance only of the combined form of jeevan and body. This too has already come into the human's understanding. It is the body that is living and lifeless; lifelessness is simply the separation of jeevan. Livingness itself is the proper expression, the manifestation, of jeevan and body. In this sequence, recognizing human satisfaction and jeevan satisfaction has been a necessity. With human satisfaction, jeevan satisfaction does become meaningful. The study of this fact has become clear before. Human satisfaction being in the form of the goal — human jeevan is evidenced becoming meaningful. In this very sequence, for study, the human adopted the realisation-oriented procedure by the realisation-based method. Its clarification and mention is what is here. Attention to jeevan satisfaction by the human's spontaneous method is necessary for this very reason: that only with the deployment of jeevan force and power do body protection, nourishment, and societal motion (*samaj gati*) become clear. In the situation of jeevan not being there, the protection and nourishment of the body cannot occur. On the contrary, such a body is declared a dead body and is consigned. In this way we come to this conclusion: body, nourishment, protection are accomplished only with livingness. Therefore, as much as we are able to know, we are able to desire less than that; as much as we are able to desire, we are able to do less than that; as much as we are able to do, we are able to consume less than that. The result comes to be known: as far as the limit of consuming goes, it is the body alone. For the nourishment and protection of the body, the use of things has been recognized; and the activity-processes of things useful for societal motion have also been recognized. The tele-communication machines and instruments that are employed or are useful for societal motion are given the name telecommunication, in which far-travel, far-seeing (television), and far-hearing are included.

In the awakened human tradition, the use, good use, and purposeful methods of things get accomplished and get evidenced. Usefulness — that is, the limit of a thing's usefulness — becomes clear in the form of family-based necessity. Production more than necessity has become possible in the human tradition for this reason: that whatever we produce, however

much we produce, we are not able to consume that much. Therefore the formula of production more than necessity becomes clear. This production more than necessity became spontaneous by this method: that there is inexhaustible power and force in jeevan; production work being accomplished in the combined form of jeevan and body;

[p. 115]

its use being deployed in the form of body nourishment, protection, societal motion — which remains limited, that is, whose limits remain determined. This is natural. Even now, in the situation of the human tradition remaining deluded, it has been seen that the fewest people are engaged in production work, while more and more people keep using. Even from before awakening, the evidence of production more than necessity being carried out in the human race is clear. Even so, the cause of straying is one alone: we are told in our schooling — “Necessity is infinite, means are limited; therefore only through struggle shall we be able to fulfil our necessity.” From this viewpoint, the human’s giving more attention toward accumulation and comfort, the satisfaction-point of accumulation-comfort not being found, necessity came to be assumed infinite. This itself is the basis of straying and delusion. We shall be able to escape from this whirl only when it becomes clear and evidenced that the necessity of every family is limited; the possibility of fulfilling necessity is greater; jeevan powers are inexhaustible; production occurs only in the combined form of jeevan and body; the body’s necessity is limited. From this viewpoint our attention goes toward prosperity. Its source is precisely production more than the family’s necessity.

By the said method, the determination of the family’s necessity: within the family itself, one or more than one person holds the capability of producing more than the family’s spontaneous necessity. After there is an understanding-endowed family, in one family itself 2-4 persons become possessed of such production capacity. When there is production more than the family’s necessity, then in the understanding-endowed family the good fortune of resolution-prosperity being evidenced dawns. From this, this family’s becoming endowed with gladness and trust for the family members comes about. Every member of the family becomes worthy of trusting in himself. From trust in oneself alone — respect for excellence occurring, the evidence of understanding occurring, and, in the evidence of endowment with understanding, the evidence of the person being social in behaviour and self-reliant in occupation dawns of itself. Such dawning-capacity is the fruition of the human’s being a unit of the knowledge order (*gyanavastha*). Existence in the form of coexistence is continuous. Therefore darshan-knowledge is continuous; jeevan is continuous, therefore jeevan-knowledge is continuous. Humane necessity is continuous, therefore humane-necessity-knowledge is continuous. On the basis of these very treasures of knowledge, ascertaining the method by which the jeevan goal and the human goal are evidenced — by the method of wisdom-endowed science and science-endowed wisdom — is itself the entire coexistential management, treatise, thought, and darshan; this itself is existence-based human-centred contemplation knowledge, Madhyasth Darshan.

[p. 116]

In this sequence, in every dimension, the unceasing possibility of being endowed with darshan, thought, treatise knowledge has indeed remained formed. That is why the human tradition's becoming awakened is an inevitable situation. For this, existence-spontaneous inspiration is evidenced in the human of the knowledge order, is eternally effective. Therefore the human is assiduous in thinking, understanding, being evidenced. In this very sequence the human's all-round rise (*abhyudaya*) gets evidenced. The human's *abhyudaya*, in its own form, gets evidenced only in the form of all-round resolution — that is, complete resolution. Complete knowledge alone is complete resolution. Because only on the basis of knowledge do science- and wisdom-approved resolutions emerge in the form of decisions. This is an inexhaustible activity; it is a continuous, ever-and-ever activity.

This fact has become clear: that the human, on the basis of understanding, in the course of being projected, presents realisation-evidences, in whose fruition jeevan-aspiration and human-aspiration being evidenced becomes clear. Along with this it also becomes clear that, by the realisation-based method, the methods of making the understood understood, teaching the learnt, getting the done done become meaningful through realisation-based projection. In this very sequence it has been indicated that whatever is the human's production, it is to be use within the limit of his family, good use in the meaning of society, and purposefulness in the meaning of universal system. It has also been indicated that the human's necessities are within the limit of body nourishment, protection, societal motion. Societal motion is in itself the combined motion of undivided society and universal system. Undivided society has in itself become quite clear earlier.

After all families are endowed with resolution and prosperity, where will they deploy things — this question does arise in the same form. In this, it has been experienced in this way: that after being endowed with resolution and prosperity in the human family, the propensity of benevolence (*upkar*) dawns. Only the people's representative of an understanding-endowed family will participate in the overall orderliness. Whatever things get deployed for societal motion, all these remain provided from the prosperous family alone. Up to this point, in every condition — that is, however awakened one may be, even after that — deployment does occur. In this way, only together with societal motion are humans able to evidence orderliness. A people's representative participating in orderliness will be of some family only. However many things are needed for their body nourishment, protection, and societal motion, all that will remain provided by the understanding-endowed prosperous family. In this way, from every family,

[p. 117]

participation in societal motion, contribution, and the use, good use, purpose of things remains ensured of itself. Glorified in this very state-motion, being in the form of the awakened human tradition is found.

In the discipline of awakened-human-spontaneous projection-reflection activities, this was presented while experiencing the necessity of making study on certain issues. The root intent of the projection-reflection activities has been recognized in the meaning of presenting, in every human — that is, in every man and woman — the evidence of awakening healthily, beau-

tifully, pleasantly, with endowment of good fortune. Recognizing supreme good fortune in every human in the form of awakening, understanding, knowledge, science, wisdom is a spontaneous activity. The evidence of pleasant state-motion is found to be mutual recognition with resolution and prosperity, and trust. The trust of being happy too becomes possible on the basis of resolution and prosperity. Beauty we recognize in the awakened human tradition in the form of personality; personality is in itself the food, lifestyle, and behaviour practised in accordance with understanding. Through the observance (*sevan*) of behaviour, the observance of relationships occurs, together with relationship, values, evaluation, and mutual satisfaction. In such observance, both served-ness and server-ness remain contained. In the discipline of the served and of service, all relationships come to be honoured in the meaning of purposes. As a result, the observance of purpose does occur. The chief form of purposes is the evidence of awakening, of the human in orderliness, and of aspiration. To recognize every relationship in the meaning of these purposes is the glory of understanding.

In the human, from imaginativeness and freedom of action up to understanding, honesty, and participation — the grandeur of study, experiment, and evidence that there is, is evidenced only in the human. This is the same in, from, for all humans; whether one be small or big, weak, thin, fair, dark, in any of the countries that are constituent limbs of the earth, in any time; in all humans the possibility of understanding, the possibility of attainment, and its at-hand-ness are the same. The evidence of attainment — this is found to be the complete, glory-filled frame and mould of becoming clear, with orderliness, in the human tradition. Such a frame and mould, or this grandeur of the human, is able to be evidenced by the projection-reflection method. There is no other measure or process for it. With the projection-reflection purpose of understanding, the human in himself being projected-reflected as formula and explanation in the form of undivided society, universal system, is itself the evidence. This — study, teaching, values, evaluation, resolution, prosperity, fearlessness — being evidenced in the form of coexistence is in every way readily attainable

[p. 118]

and accepted. This being evidenced is itself the purpose of projection-reflection. This is also the purpose of the human tradition. This alone, by the destiny method, is the destination-site. This alone is the necessity of all humans.

Karm Darshan — Chapters 3.13–3.15

3.13 Pressure, Flow, Wave, Electromagnetic Force (दबाव, प्रवाह, तरंग, विद्युत चुम्बकीय बल)

[p. 118]

Pressure — the compulsions received for generative-degenerative (*sam-visham*) excitation (*āvesh*), as distinct from natural-state motion, are pressure.

Flow — the continuous motion of fluid matter (*ras dravya*) toward a slope is flow.

Wave — in solid, liquid, and rarefied [matter], waves are found to occur in different forms and in different ways. In a solid thing, the wave is in the form of vibrational motion. In liquid (water), the reaction produced by the contact of air, or by the contact of some substance, animal, or human, is in the form of a wave. For example — from a human throwing a stone, from jumping, from the pressure of air — water runs along with vibrational motion (it goes up and down). This itself is known by the name of wave. In rarefied matter, sound (*śabda*), heat, electricity, ray, and radiation are evidenced in wave form.

Electric wave — this is the flow produced from the fragmentation of magnetic current. The small-small forms into which the magnetic current gets fragmented — those pieces are transmitted through some medium, that is, they run. Regarding the medium: the whole of nature is found to be the holder and carrier of electric current. The whole of nature is receptive to electricity, at the least or at the most. This being less or more gets determined by the method of pressure, flow, and quantity.

Sound wave — sound waves and language waves. Sound is found to occur from the collision of more than one thing, or from a self-motivated activity occurring within one [thing]. In its application, sound occurs from rubbing any two stones together. Sound occurs from any two metals striking against each other. In the same way, sound also occurs when leaves move in the wind. In the same way, humans produce sound through the combination of the throat, palate, lips, and tongue; this is called melody (*rāga*); this too is sound alone. In the same way cows, oxen, buffaloes, goats — animals — execute sounds each in its own manner. The sounds of animals, birds, frogs, and so on may well be language for those respective species, but for nature they have been accepted only in the form of sound. In the same way, for the human too, his own language may well be meaning-coherent,

[p. 119]

but for the rest of nature it is evidenced only as being sound. There are some animals that imitate human signals. In this way, the clear form of sound and language comes into the human's understanding. The word waves that indicate meaning are called language waves. Upon however many rarefied substances are connected with the site of production of both these kinds, its pressure is found to occur. Consequently, the pressure that got imposed upon the group of molecules at the site of the atmosphere, and the vibration that got prepared in them — this is what we are calling wave. By this method, waves — being transmitted from molecule to molecule, or being animated onward — reach far and wide. The activity of broadcasting such words and sounds by means of electric conduction is being regarded as radio and television waves. In this form, it is necessary for us to understand the word wave for this reason: however many words we humans use, it is necessary to keep their meaningfulness maintained in our view. Because we ourselves want to be meaningful. The form of meaningfulness has already become clear earlier. The formula of meaningfulness is from the human being understanding, from living in behaviour and system, from evidencing jeevan-aspiration and human-aspiration. That is why it is necessary to use every word in the meaning of meaningfulness.

The human sees the electromagnetic wave, by the natural method, in the form of flashing lightning or in the form of light. At its root: in the form of clouds at a definite distance — the sound that occurs when a definite, good, dense cloud comes near from within its own definite good distance is itself called the thundering of clouds. Upon these two coming near, with the conjunction with the earth, with the earth's relationship becoming joined, the electric flow runs of its own accord, whose flow has been seen upon animals, humans, trees, and plants. This is lightning's light and effect, seen in natural form. Lightning's light was indeed seen by the wayfarer in the form of showing the way, but the flow was not used in any other positive aspect. Having seen both these situations, the human [asked]: What is this? How is it? — and thought and understood a great deal. Ultimately, by the fragmentation method of magnetic current — which is called a dynamo — rotating it along with a bicycle wheel, light was obtained. After this, in sequence, electric flow running everywhere upon the earth, doing work — all is on display.

- The declared analysis regarding electric current is on two points:
- The source of electric current, and

[p. 120]

1. The activities occurring in the current, in the flow.

At the root of electric flow: electric current being alongside the fragmentation of magnetic current; electric current not being free of magneticness; consequently, the naming “magnetic electric current” is found to be meaningful. In this, [it was said that] atomic particles keep running along with the current — such a hypothesis was given. If we become ready to test it in reality, then we find this: the contraction-expansion of molecules that persists in every

medium in the form of natural-state motion — in the situation of [the medium] being the medium of electric flow, that contraction-expansion increases. It is by the contraction-expansion method alone that flow and pressure persist. Pressure by the contraction method, flow by the expansion method — this is seen occurring. In this sequence, the running electric flow spreads its own effect upon however many rarefied things there are in its nearby environment; as a result, along with the electric current its field of effect remains formed. This effective field can also be seen in the form of a very slight pressure-flow, and it can also be seen with the greatest pressure-flow.

Electric flow, within the limits of control, is not any harmful thing in itself. Nor is it, in itself, any pollution-laden energy. This electric energy is in itself pollution-free. Whether pollution is produced from its use or not depends on human discretion (*vivek*). Making oneself well regulated in this is naturally easy. On the other hand, the need there is to become engaged in obtaining it — that is, electric energy, electricity — this being pollution-free is possible only when we are able to see the earth's balanced temperature as the priority point. Today it is precisely this view that is needed. The form of the view is seen doing meaningful work in the form of mentality — knowledge, discretion, science.

By the coexistence-ist method of knowledge, discretion, and science, we can bring into attention the coexistence of the earth and the human. In the situation of the coexistence of human and earth coming into understanding, the earth's health coming into the priority position, and the aim of freedom from pollution coming into the priority position, will remain a natural process. The alternative is clear from before. There is need of giving a little attention.

[p. 121]

Whether we use the force of water flow or not, the flow does remain formed in every place and time. The precision of seasonal balance being the source of the unbroken current of these rivers — this is acceptable to the understanding human. Along with this, how much the proportion of forest and minerals ought to be upon the earth — attention to this too is quite clear. The point of giving attention in this is just this, that in every place (*desh*) different situations have formed. In every difference, the seasonal balance of that place remains quite clear in itself.

By alternative methods — that is, by the pollution-free method — it is necessary to obtain more electricity than what we are getting; for all the vehicles that run on roads, for them there is the need to store up electricity by the battery method, so that the smallest to the largest vehicle can run. Its availability can become such as mineral oil is available. Every understanding person can accept this. As far as the matter of vehicles running in fields and vehicles moving in the air is concerned, for them we will make vegetable oil suitable and use it. For ships moving on water we will keep all three adopted — vegetable oil, or solar energy, and the battery method. In this sequence, if the human mind gets readied, if the human once applies strength, then in the technological world — that is, humankind grappling with flow-force — the sinful deeds and criminal deeds happening against nature can stop.

We have already accepted that, by the method of destiny, the manifestation of the human [came] after the manifestation of the plant order and the animal order. We have understood

it as well. Despite this, we became joined to crime against destiny; release from this is necessary. If we reflect on both the aforesaid sources — water flow and the sun's heat — then it comes to be known that whether the human uses them or not, the flow remains. The sun's heat remains touching the earth at all times. We can understand this quite well. We can adopt use and the technology method with our knowledge, discretion, and science. Then it is probable that the electricity source — many times more than however much the human needs — remains available with us.

Every human keeps the wish of remaining rich in energy sources. The understanding human does keep living in the meaning of ensuring use, right-use, and purpose. From this, the basis for human trusting human is also probable. Only by the method of mutual trust along with humans

[p. 122]

can both the aforesaid kinds of sources be used. By this alone can the human on this earth become free from these destiny-opposing, human-opposing, nature-opposing programmes. In place of opposition, being mutually complementary, useful, and cooperative gets evidenced.

Mention and use of magnetic-force endowment at the root of energy activity has already occurred. Such magnetic-force endowment — from where, how? It is natural for the question on this issue to be in every human who is ready to study. On this issue it has become clear that in the pervasive entity each and every thing is submerged, soaked, encircled. On the basis of remaining soaked — energy-endowment; energy-endowment itself being force-endowment; force-endowment, in the form of magnetic-force endowment, is present in every unit. In evidence of this it has been made clear that the atoms and molecules of every species are endowed with bonding, weight, and force.

The pervasive entity is permeative in things throughout the whole of nature. Therefore every thing remains soaked in the pervasive entity. Only after a thing is witnessed manifesting energy in itself do we humans come to have the inference of the thing being energy-endowed. Within such inference alone: What is its source? The answer to this — after having the knowledge that all things reside in the pervasive entity itself, it came to be known that the pervasive entity itself is the fundamental uniform energy (*samya oorja*). In the form of energy-endowment, every thing — whether it be a molecule, an atom, or even an atomic particle — all these units remaining energy-endowed became understood from their perpetual activeness. In this method, in every unit the acceptance of energy-endowment, force-endowment was accomplished on the basis of state and motion. Such energy-endowment came into the human's understanding in the abundance of every unit, in the form of grandeur, in the form of magnetic-force endowment, molecular bonding, and weight bonding. These entire things, while remaining complete in themselves, are seen evidencing the complementarity-necessity with the whole — that is, with the earth. On this issue too it has been clarified, in the form of states and motions, that solid, liquid, and rarefied things are in readiness to evidence cooperation and usefulness with things of their own kind. By this method, however many work-configurations are constituent parts of the entire grandeur of the earth, they are all with natural

expression alone. Humans, with their marvellous craft and mechanics, undertake however many ventures for producing electric current, for making it flow — and in those ventures flow is obtained too. That flow, ultimately merging into the earth itself, evidences coexistence.

[p. 123]

Magnetic substances are found in the form of matter that is a constituent part of the earth itself. Through their mutual mechanics, the presence of magnetic current; through its fragmentation, electric current; after its complete purpose, or after its use, the entire electric current, merging into the earth, becomes converted again into magneticness in the form of magneticness. This process has been mentioned here because this electric flow is a recurring (cyclical) process. Therefore it is proper to keep it maintained in the form of a necessity. For its attainment, the possibility of re-coordinating the venture method, of its being joined to perpetual sources, is indeed opportune. Hence, by this method, we reach from magneticness to electric flow and again up to magneticness. In the form of magneticness neither decreasing nor increasing, it will be proper to recognize the entire thing as saturated in the pervasive entity.

This fact has come into our understanding, that magneticness manifests in things. In the situation of fixing such magnetic substances face-to-face, by a mechanical method, at a definite good distance, in the mutuality of these two a magnetic current does remain formed. Magnetic current means the tendency of meeting with one another. However many molecules and atoms remain in rarefied form between these two things — these are found to be within the magnetic field of effect. Its fragmentation — through its fragmented sequence, [the medium] is seen receiving the current, the flow. This, once again, reaches far and wide by means of a medium.

In such a fragmentation sequence, whether any thing-matter remains formed or not — on this issue just this becomes clear, that in every void (*avkash*) there are molecules in some number or other. That these very molecules are also in the flow-field of the magnetic current has become clear. In the fragmentation sequence, it is also natural for the molecules that have come into the magnetic flow-field in this void to be affected by the electric current. Along with this, it is also inferred that, with the magnetic effect and the fragmentation pressure, the possibility remains of these molecules disintegrating into atoms, or of atoms disintegrating and racing along in the form of atomic particles (along with the electric flow). Nevertheless, the effect occurring upon the medium along with the flow, and the activity occurring as its result, is clear. As soon as electric flow flows upon a medium, the increase of contraction-expansion in it does happen. Every inquisitive person — that is, one keeping the wish to understand with experiment — can test and observe this.

[p. 124]

However many ventures have been made for electric flow, and however many instruments have been made for controlling the flows, regulating them, dividing them, using them, measuring them, and making them definite — they seem sufficient. If, in the situation of some further need ahead, the research-investigation tendency is there in the human anyway. From this, supply is probable. Being assured by this, necessarily using the perpetual, continuously

obtained sources for operating electricity-executed machines will itself be our fortunate future.

Among the attainments that have come, up to today, from the industrious human in the form of the battery, there is the cell battery and the plate battery. In the first, the cell battery, one carbon plate is found; around it, chemical matter and a casing of zinc or lead is found. The chemical matter that remains inside it, reacting with the lead or zinc, becomes excited in the form of molecules and keeps transmitting electricity in its field of effect. These fields of effect, joining one with another, remain joined with the carbon. That is why electric flow is able to become available in it. From this battery we see bulbs burning.

By the second method, in the plate battery too there are chemical substances — acid, salts, and other substances. Acids there certainly are. It remains natural for reaction to be accomplished in the metals that have come into their contact. In these, to charge the metal molecules, a flow is delivered; this electric flow exerts effect upon the metals installed in that battery casing. As a result, by chemical combination, the molecules of the metals become excited and become receptive to electricity — this itself is called “charge.” In this sequence, as a result of the effect produced from the electric effect becoming complete, that battery is seen being made use of in activities such as light, and being used by the human in craft and vehicles. From this, at the beginning of operating a machine, electric flow is applied into it. It is a universally known fact that, along with all these facts, according to the capacity the human has in today’s situation, [humans] have become adept in the production of electric flow by all these methods, in its control, and in its working methods. Therefore, on all these issues, in the technical knowledge that exists, there is no [remaining] need of ensuring use, right-use, purposefulness, and that there be no disproportionate exploitation of nature.

3.14 Place, Direction, Distance, Area, Angle (देश, दिशा, दूरी, विस्तार आयाम, कोण)

Every human wants to examine all these issues. For knowledge, for understanding. What is the meaning of distance? What is its purpose? Every human’s attention does go to this.

[p. 125]

At the root of distance are the human, the eye contained in the human, and the various things reflected upon the eye, situated amid mutuality. This, fundamentally, became the form of the situation. Various things remain reflected in the human’s eyes. According to human language, some things are seen nearby. Some are seen at a distance. On this very basis we see, far-far away, the sun, moon, and stars. Close by we see the earth, air, water, mountains, plants, insects and worms, animals and birds, and humans. In this way, things do remain ever-ever reflected upon human eyes. When we are able to see them, even then they exist; when we are not able to see them, even then they exist. On the basis of these very facts, we want to explain the interpretation of distance and measure to others as well. We want to understand it ourselves as well. Whether it be far or near, every unit remains contained in the

pervasive entity itself. Even while remaining contained, near and far appear to us. By this method, the meaning of distance turned out to be this: we experience the situation of being submerged in the Omnipotence. On this basis, the fact of measuring distance becomes clear — that between one another we find only the pervasive entity in the form of the measure. This is able to be accomplished by two methods. As we see the sun, moon, and stars far-far away: these very distances — by installing on the earth two poles or two cones, making the sun, moon, or stars one target in the form of the meeting point of these two, on the basis of the various angles of these two, on the basis of the meeting point of these two — we ascertain the distance. The name of this is: making the unknown distance known. The second method is: making the known distance known. Such an occurrence is found to happen only upon some composition. The composition remains known. The distance remains unknown. For instance, on the earth we make measurements of many kinds — one kilometre, two kilometres, and so on. This earth is, in itself, one composition. We begin the measure at some one cone or at a pole point, and measure up to there whose distance is to be measured. This distance was known; we measured it. We have awareness of the activity of measuring. That which we measured — of this too we have awareness. Now, what sort of thing is measure? Awareness of this too is necessary.

When the human had need of weighing small things on the physical balance, then, taking the subtlest weighing of the physical balance as a definite point, the fragmentation method was adopted by the mathematical method, on the basis of its tenth parts and hundredth parts. Moving forward in this very sequence, by electronics, by the technological method, hundreds of thousands of divisions in each square inch — dividing the square into hundreds of thousands — numeration was done. Its use is indeed being employed in the form of the electronic recorder. For generation after generation ahead

[p. 126]

to use, all these are available. In the sequence of measuring length, breadth, and height, the measuring thing remains made of some metal or other or of wood. Such length, breadth, height — or rather, all lengths, breadths, heights — are contained in the Omnipresence; this fact is known to us. Whatever we measure between one thing and another thing, between pole and pole we are measuring pervasiveness itself. The distance between these two we take to be its definite distance; we numerate it. We keep clear confidence.

The meaning of bringing this into attention is just this: whatever we measure in the form of distance, amid mutuality there is only the pervasive entity. In the form of all measuring-standards of this kind, we suppose that, by measuring the pervasive entity, each single thing has been measured. As is length, so is breadth, so is height — within which all units come. Just as this earth, on the basis of remaining submerged, encircled, soaked in the pervasive entity — in the name of the thing, it is within the thing itself that we keep measuring every thing. Because coexistence is the ultimate truth, the purpose and process of measurement succeeds. In this very sequence, the work of weighing also succeeds. The fragmentation system also succeeds on the basis of measuring-standards. Only on the basis of the human being fortunate — that is, only on the basis of living with restraint — have humans got into the palm of

their hand the measuring-standards for decreasing and increasing, for [everything] from the subtlest signal up to the grossest signal. In this way, measuring-standards, in the end, are in themselves methods of recognizing some thing — or motion, pressure, waves, words — in the form of increasing-decreasing their subtlest and grossest motion and pressure. These have mostly proved suitable for telecommunication.

Extension (विस्तार)

(Extension, in itself, is equal to the span of the composition.) Whatever length, breadth, and height a composition, a unit, is spread over — that is its extension. At the root of composition, this fact has become known to us: from atoms, molecules; from molecules, molecular compositions; the matter of being small and large has become clear. Many earths like this earth are also compositions composed from molecules. On many other planets and spheres too there can be solid, liquid, and rarefied things like this earth's. Planets and spheres of many kinds do remain reflected before our eyes. We also know this: far-far away there can be very many earths. Regarding this earth too, effort was made to recognize corner after corner. The wish to recognize other earths does remain in the human. For this, by the technological method,

[p. 127]

effort has been being made for a good many years. All this will keep on being possible at its own pace, in proportion to the efforts. The main issue is that of the human on this earth living together with mutual trust.

For living on one's trust, we have understood first — there must be trust in oneself. It is in honouring excellence, on the touchstone of personality, in evidencing talent, in being social in behaviour, in being self-reliant in occupation. Every human wants the prestige of trust. Trust in oneself is found to be meaningful in just this much. Only then does the human tradition become assured for ever and ever upon this earth.

The extension of this earth has become definite in itself. By the human's measuring-standards as well. The earth's terrain is self-proven in itself. This earth is clearly a composition complete with the coexistence of molecules of various species. Upon it, chemical structures too, manifesting of themselves, have been evidenced up to the human body. The human, in the combined form of body and jeevan, is entitled to study the whole earth, many planets and spheres, up to cosmic rays. The benefaction of all these has become available to the human. Along with this, the study of the human remained incomplete for the human. Its fulfilment remained necessary. For this, the appropriate method became clear in the form of knowledge, discretion, and science. In this sequence, we have begun to understand the spread of composition in the form of extension. This extension has also been numerated on the basis of measuring-standards. With designations such as mile, kilometre, and so on, the extension of this earth is indeed presented for the human, together with sufficient material. In the upper part of this very earth's extension, unbroken abundance is indeed presented. The foremost abundance is the forest. For keeping all these maintained, attention went to the need for seasonal balance, which we have clarified earlier. Therefore, while understanding the earth's ex-

tension, commitment, tendency, and activeness for keeping the seasonal balance maintained are necessary.

Place (देश)

It is this extension itself that we know by the name of place. By the prevailing method, the names of many countries have been recognized. If we think with complete honesty, then the extension of any one composition is itself place. For example, this earth is indeed endowed in itself with a definite extension. The earth, in itself, is neither divided nor fragmented. The undividedness of this earth is, of itself, known to all. Despite this, there has been the attempt to divide it in the name of many countries and states. This earth's being undivided is, in itself, also the inspiration for the human upon this earth

[p. 128]

to recognize himself in the form of undivided society. Only after the human recognizes his undividedness does the possibility of the human being secure on this earth arise. As long as humans remain fragmented, the possibility of the earth continuing to be damage-stricken remains formed. Hence, the earth being one composition in itself, all the units present in indivisible form in this very composition are joined with the earth's undividedness. In the same way, every composition, every composition of the earth, is in itself unit-complete. We can recognize this earth in the form of an example of such an undivided earth. That all four orders be evidenced upon an earth — this itself is the import of a developed earth or a developing earth. On this very basis, the composition of this earth and its magnificence come into the human's awareness. By the undividedness method, the arrangement for studying and evidencing undivided society and universal system in, from, and for the human has become easily available for the human.

Upon this earth, every plant, animal, and human is a composition, one by one. All these are grandeur only together with the earth. All these are each a span of composition. Every earth, tree, plant, animal, and human is evidence in the form of span-bound composition. All these, on the basis of their own spans, are evidencing the spans. Just as the length, breadth, and height of the earth is measured, in the same way the length, breadth, and height of the human is measured. In this sequence, trees, plants, stones, gems, and metals too are found to be compositions each of its own manner, and their recognition is found to occur together with measure and weight. By this method, the magnificence of composition, its span along with the composition, and the mutual complementarity and usefulness in these keep becoming clear of themselves.

Only on the basis of composition does the matter of decomposition and re-composition become clear. The earth, a composition in itself, is present in the meaning of its continuity, in the meaning of clarifying development in the development progression and of clarifying awakening. Because upon this earth all four orders have been evidenced. The earth remains limited to its own composition. Upon this earth all orders and statuses have been evidenced; they have become present in zero-attraction (*shunyakarshan*). On this basis, when a composition becomes endowed with complete grandeur, then these four orders manifest. Together

with the four orders, the magnificence and dignity of this earth has become quite clear. For instance: when the four orders are not upon an earth, then the human too is not there. Only after coming to be, the human, out of delusion, has done earth-opposing work. There itself, with awakening,

[p. 129]

it is necessary and opportune for the human — in accord with this earth, that is, in the sequence of evidencing development and awakening — to set himself in order, to evidence himself, and to make his work and behaviour clear.

Direction and Sight (दिशा और दृष्टि)

Regarding direction, it is prevalent for the human, standing facing the sun, to recognize direction in the form of front, back, right, left. Names have also been given to it — east, west, north, south; this too is prevalent. After this, thinking about the original emergence and purpose of direction remained a natural activity. Every issue is found to be determined only in, from, and for coexistence. In this way, it is natural that direction too is determined only in the meaning of coexistence. In coexistence, the method of complementarity and usefulness remains contained. In this sequence, for recognizing direction, it is necessary to recognize some one [thing] in the form of a pole (anchor). Just as we recognize the human, together with the earth, in the form of the pole. One point becomes the center of many degrees (*ansh*). Upon joining two degrees at some distance from the center with a straight line, an angle is formed. By this method it comes into understanding that each one is endowed with infinite angles; it becomes clear that angle is only by the method of the combination of degrees.

In the aforesaid way, every thing is a center point, and in every center point infinite degrees remain joined. As before: by spreading 45 degrees, as one set, far and wide, there come to be 8 directions on all sides of a thing. In the same way, by the division method of 90 degrees, 4 directions are formed; upon dividing by 180, 2 directions are formed. In this way, for determining direction, it comes into understanding by the method of one thing being the center of many degrees. The second method is just this: one thing in front of another thing — about the sun in front of the earth we know from before. In both these disciplines, the angle (of some center) becomes clear on the basis of degrees. Because the sun too, and the moon too, is a center of infinite degrees alone. Whenever direction is determined on the basis of the sun, it will be at 90 degrees or 180 degrees of the sun. 90 degrees is formed on the basis of the one recognizing the direction; 180 degrees is formed on the basis of being seen.

In the form of the seer, we have already recognized the human. In whichever direction the human's sight runs, with both eyes it forms just 90 degrees; the very name of this is the span of vision (*drishti pat*). The beginning of the 90 degrees is in a point. This point is right behind the two eyes, at the very place where the nerves of the two

[p. 130]

eyes join; it remains established in the brain (*medhas*) system itself; it remains established in the form of a physicochemical system. The visual system remains active, in itself, together

with the chemical composition system and, including livingness, with mentality. The meaning of this turned out to be that only in the presence of the human (jeevan) can the matter of awareness of direction, time, and so on be spoken of. Even if, by the mechanical method, we do direction- and time-related activity, in that too all the activities stated before do remain related to the human. Hence, at the root of instrument evidence, the human alone is the evidence. At the root of self-evidence too, the human alone is, because the human alone is the evidencing unit. At the root of book evidence too, the human alone is the evidence. In this way, in the sequence of understanding the human's method of evidence, understanding the human visual system also remains necessary.

The span of vision, out of itself, forms an expanse of 90 degrees in every human's visual system. In this sequence, upon every thing coming into the span of vision remaining at a definite good distance, its extension is able to be cognized through the visual system. The activity of cognizing occurs only in jeevan. Through the visual system as well, it comes into understanding on the basis of human jeevan and body being an indivisible form. Such grandeur-endowment is a necessary process. This can be recognized with research in every human — in oneself too, in others too.

For recognizing direction and place, being endowed with sight is an indispensable condition. Without it, the ascertainment of direction, recognition, and the evidence of usefulness are not possible. In this — principally in the context of sight, in the context of recognizing the seen, and in the context of evidencing usefulness, complementarity, and purpose on the basis of these recognitions — the human alone is the sole capable unit. The need of determining direction is upon the human on this earth. There is dealing also with the planets and spheres existing outside the earth. In this sequence, for moving in the sky too, direction-determination is a necessary condition. It is necessary in water voyages too. On the earth, for going from village to village, direction-determination is extremely necessary. For the awakening progression, for recognizing awakening too, a definite direction is needed. In this way, on the basis of human tendencies being multi-dimensional, on the basis of their being multi-angled, it is found that work-determination happens only on the basis of direction-determination.

By the land-moving, water-moving, sky-moving methods, wherever we have to move, for that the need does remain of determining the destination (*gamya sthali*). Only after such determination are we able to reach the definite goal, the destination, only by the definite-direction method. Every person can test this on the smallest to the largest issue.

[p. 131]

Beyond this, it has also become quite clear that without sight, direction simply does not get determined in itself. Direction-determination becomes possible only together with sight. The center of sight is the human alone. It is in the human alone that the sight of understanding remains contained. Together with the visual system, along with the knowledge system, the activities of thinking, thought, direct recognition (*sakshatkar*), enlightenment (*bodh*) including visualisation, and realisation (*anubhav*) are accomplished in the human. For this, it is necessary to keep recognizing the coexistence of jeevan and body in the human. On this issue clarification has been made before as well.

It is clear that sight in the human becomes meaningful in all dimensions, angles, and perspectives only by the coexistence method. That is why it comes into understanding that goal and direction-determination happen only with sight foremost.

Angle (कोण)

In the context of angle: after recognizing some one unit in the form of a center point, it has become quite clear that very many degrees are contained in the point. However many degrees we can conceive of, more degrees than that remain joined in one point. Upon establishing, at such a joined definite point, the target line that joins the parallel line (the base line), angles are able to become clear. Upon joining every two degrees, an angle of definite degrees does get formed. In this way, in each one, from one up to infinite angles are contained. The recognition of degrees happens only on the basis of straight, concentric lines. Concentric line means a line joined to one point and spread out on all sides; this has been recognized by the name of the degree-dividing line. By this very method — concentric lines, a great many joined in one point — every one of us persons can make this figure. As the distance of such mutual lines from the center goes on increasing, so the mutual distance between the lines also goes on increasing. In this very sequence, the span of vision gets recognized. It becomes clear as well, accepted as well. Degree, angle, extension, distance — all these are facts within the reach of human sight. That is why, keeping human sight in the basis, the method of recognizing all facts is formed. In the same way, by a second method: after recognizing two poles upon some flat composition, and — on the basis of this same understanding — after recognizing three poles, upon joining poles with poles the recognition of angles occurs. Every angle is found to be a figure of some definite numerical degrees. In this way, both direction and angle become clear. Along with this, distance too becomes clear.

Dimension (आयाम)

[p. 132]

We have always been using dimension-related language. Any one thing, while being bounded from six sides, we speak of only three dimensions. In this too, the human's sight alone is the principal basis. For the six sides of any thing to be reflected in the human's eyes, the need remains of seeing from at least three manners (sides). This itself is what we call three dimensions. The unit, in its form, is soaked, submerged, encircled in the pervasive entity. On the basis of the pervasive entity being transparent, in the human's span of vision the position and circumstance of a thing, and the reflection of things occurring in the eye, is being seen in the form of sight-points (*drig bindu*). The things reflected in the form of sight-points can be reflected upon the human eye up to 180 degrees of their complete shape and volume; more than that they are not able to be. All things reflected upon the eye — that only a partialness out of themselves comes to be in the form of the reflection — [every human] can [ascertain] this with testing and observation. Every human can experiment with this. For experiment, various things are placed right before the human. In this: upon one human standing before a human and looking — regarding length, breadth, thickness, and build, upon looking from a

definite good distance — 180 degrees, that is, only half the portion of the human-formed thing, is visible. The remaining half portion remains hidden. In this way, what is seen with the eyes is incomplete. The decisions that are made only on the basis of seeing with the eyes are also incomplete. However many programmes are based upon this, it is natural for them too to be incomplete. The human, in his sequence of gaining satisfaction, does not accept incompleteness. On this issue it has already been clarified in a general form that mathematics is more than the eyes, less than understanding. That is, the awareness that comes from mathematical language is more than from the eyes, while the matter of awareness occurring on the basis of the eyes also comes into understanding, or the matter of being depicted comes in. A picture too remains a thinking-and-considering formed on the basis of the gaze; it too remains incomplete. In a picture, only 180 degrees of shape and volume is able to be seen. In the gaze too, only 180 degrees is able to be contained. Whereas the awareness that comes from mathematical language conveys the complete awareness of shape and volume. It comes into understanding that there is simply no reflection of the solid [volume] in the eyes. Beyond this, it has also been clarified that whatever comes into our understanding by the mathematical method, more than that comes into understanding in qualitative and causal language. Because the completeness of every thing is the aggregate of form, quality, innate-nature, and dharma. The interpretation related to form, quality, innate-nature, and dharma has been made before. In, from, and for the human, the awareness of every thing, only together with form, quality, innate-nature, and dharma, is able to become the cause of complete awareness and satisfaction. From any part of these remaining hidden, satisfaction for the human is not possible. A decision taken on the basis of complete understanding,

[p. 133]

and work-behaviour, will be resolution-producing. This matter comes into understanding. The human does not accept problem. He accepts resolution. Resolution emanates together with decisions taken on the basis of completeness in every direction, angle, and dimension. Every human can examine this quite well.

In the aforesaid way, however many experiments and decisions humankind has made remaining dependent on the basis of the eyes, all that, in result, has become the form of countless problems. Instrument evidence cannot be more than the eyes. This itself is the biggest evidence. The endeavour of science — using the eye, making tools for seeing in an even more subtlest form than the eyes — has come into practice. That is, the powerful lens, showing magnified hundreds of thousands and tens of millions of times; for showing billions and trillions of times, the electronic lens too has come into use. Even after all these, what happens in the eye — make the eye billions of times more effective, only that much meaning comes out. That is why: recognizing the whole from the coexistence-ist outlook, by the combined method of knowledge, science, and discretion; being able to communicate it in causal, qualitative, and mathematical language; being able to have awareness of it; and, as a result, attaining the goal in the form of human-aspiration and jeevan-aspiration — this alone is the sole necessity. For weighing upon this, direction and sight are very necessary activity. Let us understand direction in this way — by geographical methods we know direction anyway; by the

astronomical method too we know direction. Now, along with this, two more parts which are hidden — the direction of development, and direction for awakening — need to be recognized. Direction for development [means]: by the method of complementarity and usefulness with the chemical, physical, and animal order, [the human] deciding his own work-behaviour — that is, the human deciding his own work-behaviour and bringing it into conduct, and attaining the fruit and result — is the meaning of the direction of development. The import of the awakening direction too is just this: to evidence, with understanding, honesty, responsibility, and participation, harmony (*sangeet*) and concord (*samarasyata*) in the human; to evidence jeevan-aspiration and human-aspiration. On both these issues the human needs to succeed. For this, the coexistence-ist outlook alone is the perpetual resolution.

From the viewpoint of human contentment: only after taking to heart with clarity the dimensions in the form of form, property, innate-nature, and dharma does every human accomplish resolution-oriented decision in the context of development and awakening, and, as a result, become able to be meaningful in the direction of awakening and development. This itself is the summary.

3.15 Time (काल)

[p. 134]

The definition of time in the form of ‘the duration of activity’ is clear. Activity, in itself, does keep being accomplished continuously. Along with it, some activities keep recurring. The continuity of such recurrence remains formed. It never stops at all. On the basis of one recurrence of such continuously accomplished activity, the basis for recognizing time was accepted. In one rotational motion of the earth, day and night are found to be accomplished over the whole earth. This itself has been given the designation of one day. Such day-and-night activity has come on from ever and ever, and will keep going on. Dividing this duration by 24 parts, by 60 parts, we recognize it by names such as hour, minute, *ghati*, *pal*, and so on. In this manner we went on dividing time, and forgot the activity. We made ourselves ready to evaluate every activity on the basis of time. Time became primary; the thing was forgotten. From all the decisions taken on the basis of this mistake, problems arose. The need remained for evaluation to occur on the basis of activity and its fruition.

It is clear that time-reckoning is in the form of the duration of activity. Activity, in its form, is continuous, perpetual. Time-reckoning is in the meaning of being, of continuing to be. Coexistence, in itself, is in the meaning of being eternally continuous. Eternal continuity being is clear. It is this continuity that comes under the designation of time, and perpetuity too comes under the designation of time. On the basis of the whole of nature being perpetual, on the basis of its being imperishable, perpetuity is evidenced. Because the entire material order is present in the form of existence dharma; this very material order, having developed, on the basis of flourishing into the biological order, has come into recognition as being of growth dharma together with existence. In all animals, or in the animal order, being of hope dharma together with existence and growth has come into understanding. In this very sequence, it is

also clear that the human is of happiness dharma together with existence, growth, and hope. In coexistence, realisation = resolution = happiness; that happiness is only from realisation — this matter too has become quite clear. By this method it comes into understanding that existence is imperishable. That is why time is only the ever-present. In the form of the present thing there is coexistence alone. It is the present that we have given the name time. In the word time (*kaal*), the meaning is the present alone. In the form of the present there is coexistence alone. In this way it comes into understanding that time, in the meaning of coexistence, is the ever-present.

Those who recognize time in the meaning of past and future — they too recognize it only on the basis of the duration of activity. Because every cyclicity happened before as well, is happening even now, and will keep happening ahead as well. By this method, on the basis of the event,

[p. 135]

we go on fashioning past, future, and present. On the basis of being imaginative and free in action, the human, dividing the duration of a natural activity into many parts, arrives at the place of time-zero. This one small event is extremely easy for the human. Keep dividing one hour by 60; divide 1 out of that again; after doing this several times, upon being asked how much remains, they say: equal to nothing, or nothing. But this very thing became the basis of the human's going astray. That is why, in the age of science, recognizing time became most complicated. It is not possible — so it seems.

If the present becomes zero, where is human conduct to be recognized, where is behaviour to be recognized, where is the place for recognizing human knowledge, science, and discretion? That is why the human, beset with problems, began to bring problems about. He regarded this as his bravery; in this very thing, human tradition has sunk quite far. The way of escape ahead is this alone — coexistence as the ever-present, the eternal manifestation of development and awakening, and, on the basis of recognizing that the human alone is the one who evidences development and awakening — only on this basis will human-aspiration and jeevan-aspiration be able to be fulfilled.

Karm Darshan — Chapters 3.16–3.18

(Working English Translation)

Machine-assisted working translation from Manav Karm Darshan (v5), translated from page images (printed pp. 135–153). Not a published translation — verify against the Hindi original before quoting. Technical terms follow MD-Mapping.xlsx conventions. This batch completes chapter 3 and the book's main content (printed p.153 ends with the closing benediction; printed pp.154–155 are publisher back matter, excluded).

3.16 The Human Being as the Combined Form of the Prana-State, the Human Body, and Jeevan (प्राणावस्था, मानव शरीर और जीवन के संयुक्त रूप में मानव)

[p. 135]

At the root of the prana state, combinative (*yaugik*) method and tendency are found to occur by the self-motivated method. If study is made regarding the favourable circumstance for this, then it appears, in background, that it lies simply in being enriched, in itself, from cosmic rays and from atoms of many species on the earth. If one thinks about the combinative background on this earth, there is no cause greater than this. In maintaining cosmic favourableness, cosmic ray-radiation alone is the one source. Even today this thing is presented right up to this earth's atmosphere. Whatever the ray manages to reach, all of that comes to be more evidenced in the earth's own light. Along with this, heat's relation too is formed with the earth. The earth, and every atom in the earth, is affected; in such a condition, whatever other sources there are, those radiant sources keep up a circulation of radiativeness produced from, or spread from, many earths as an effect of cosmic activities. This is still ongoing even now. Along with this, this earth, on the basis of being enriched with atoms of many species, also has, within itself, a great many radiant substances at work. In this way it has been the background for the whole of combinative activity to occur, through the combination of ray, radiation, and heat. Combinative events, proceeding from the event of water, into acid and

[p. 136]

alkaline forms — the background of the possibility of such combinative events occurring may be accepted. Because even now, in another form, acid, alkali, and water combining, in various ratio-sequences, various kinds of chemical substance remain ready before us. Whatever became helpful, in these ratios, for change has always been the help of organic and other species' molecule-atoms. In this way acid, alkali, and water, together with these molecule-

atoms, are found to have been helpful in increasing the number of species of chemical substances.

In this way the activity of chemical substances becoming enriched has been occurring on this earth. Out of the union-combination of these chemical substances, the formation of nourishment-elements and composition-elements — this event, being brought forth from the continued combination of radiant rays and heat, is found to be manifest to this very day. It is seen that in the sum of nourishment-element and composition-element, the composition, presentation, and functionality of prana-sutras comes about. It is this very nourishment-element and composition-element which, becoming enriched in themselves, in the form of the prana-sutra and the composition of the prana-sutra — through this same combination of heat, through the combination of radiation, by force of vibration — bring about, in the prana-sutras, the manifestation of the respiration activity together with the composition-method. Immediately after this, the acceptance of the composition-method in the prana-sutras, for the nature of prana-cells to be a composition composed from cells, and for such compositions to be diverse, becomes intelligible. After one kind of composition becomes enriched in itself, acceptance in the prana-sutras for a second kind of composition occurs; as a result, compositions of the second kind, and, in this same sequence, other compositions, have already come to be evidenced upon this earth. All of these are together with the seed-tree method. In this same sequence, the sequence of the glory of plants, the sequence of the composition and decomposition of plants, and its continuity, are in the form of the actual condition.

The residue of decomposed plants alone became the basis of the sweat-born world. Even today this matter can be tested. Gather leaves together before the rainy season; those very leaves, at the time of rotting, produce a great many worms and insects. These worms and insects prepare the egg-born world. In such an egg-born tradition, it has remained natural for excellence to occur in the prana-cells, or there kept being talk of further excellence, and of further species. The egg-born world, becoming abundant, kept establishing itself in the forms of the water-dweller, the land-dweller, and the sky-dweller. From the prana-cells of the egg-born world, the prana-cells of the womb-born world developed. In this womb-born world, the majority became land-dwellers, whereas in the egg-born world all three — land-dweller, water-dweller, sky-dweller — occurred. Of these, in the egg-born world the sky-dwellers were more numerous; after this, just as

[p. 137]

the womb-born world too came, land-dwellers became more numerous. In the sky-dweller and water-dweller, the womb-born world obtained fewer species. After this, in this sequence, as many species developed in the womb-born world, the tradition of the human body-composition developed as the final species.

In human tradition, jeevan and body being in a combined form, activities different from those of animals began to be accomplished by the human being, by force of imaginativeness and freedom-of-action. Such as felling trees, breaking stone, digging soil; and, starting from this, building houses, making clothes, adopting methods different from those of animals in raising children — these kept coming about by the self-motivated method. Of these, in identi-

fiable form, building houses, making clothes, and producing crops came within the affirmative portion. These three kinds of act became entirely distinct from those of animals.

In this same sequence, the evidence for obtaining knowledge of body-composition also proceeded alongside. In the sequence of the composition-method within the prana-sutra, the prana-cell, and the prana-sutra as described at the root, whatever degree of excellence there was to be, kept coming about, with the species remaining as it actually is (*yathavat*) from the primordial human up to the present principal form. It is possible that the contribution of human tendency too remains contained in this. By this method the human being's ascending sequence became a chain. In today's condition, the knowledge of body-composition, its fundamental process, its measurement, the method of testing diseases, the combination of medicines — all of this, taken together, has become bound up with commerce, or has become caught in the clutches of commerce. By this method this entire affirmative portion has come into the grip of a few people's hands. From this too, the greatest inconveniences have come to be formed for the human being. Thought and consideration for becoming free from this problem are indeed under way.

The principal matter is: the tendency of prana-cells in body-composition; in body-composition, the coming-together of the prana-cells of two species as a festival; as a result, passing through the embryonic state, body-composition — that is, the composition of limbs and organs, hands, feet, and so on; the completion of the infant's composition within the womb by the time five months are complete; the enriched medhas-system being present when the infant's composition is complete, with a more enriched, more complete medhas-system than in the animal order becoming ready — this becomes intelligible. In this same period, jeevan's becoming ready to operate the body — the indication of this becoming understood by the woman who is to become a mother; after the birth of the infant, for its nurturing, the attention that used to be given a hundred years ago, the attention given fifty years ago, and being able to give even more precise attention today — in today's condition all of this comes within the human being's study.

[p. 138]

In this, curiosity is formed regarding the tendency in the prana-sutras for diversity in composition — why does it happen, how does it happen? The need to think about this issue does indeed arise in the human being. The principal matter is precisely colour and form, in which diversity comes about. No particular diversity is possible in the limbs and organs. This fact has already been understood through testing and inspection. Today's human being has already come to recognise many kinds of fluid substance with precision. On the basis of their proportional, various deployment, the colour of the body is found to occur. Taken altogether, colour comes to be known from the condition of the prana-cell, half-dried and dried, in the upper part of the body. The blood that is under the skin is red in everybody's body. It is from the upper part that colour is known. What the prana-cells display after becoming dry is what we come to know as colour. For this reason, recognising the human being on the basis of colour has not been precise in the sense of recognising the human being. For this reason the attempt to recognise humans mutually with precision has continued. It can also be thought

that, from a very long time ago, colour remained predominant for mutual recognition, and other bases too kept being sought. Along with this, race too remained very predominant. For a considerable time, humans made the attempt to keep their identity intact by the method predominated by colour and race. Testimony to this is still found here and there. Although, in mental form, from this ground — that is, from the hereditary method of recognition — colour and race have already become dislodged from consideration.

In this sequence, human imaginativeness and freedom-of-action ran to make themselves meaningful in the discipline of knowledge. Then, because of the weakness of not having studied the diversity of the world, while wishing for the inquiry of knowledge, wishing to become knowledgeable, people kept performing all the austerities, means, yoga, and practice proposed for becoming knowledgeable, but remained empty at the place of being evidenced. To obtain consolation in this, scriptures were taken as the basis, as a remedy. In this way religious texts, books, came to be taken as evidence. That it is the human being who is the one who presents evidence — this was not accepted. The point to note is just this: that if anyone is to present evidence relating to knowledge, science, and wisdom, it will indeed be the human being. From this fact, the world of knowledge-practitioners, or the coming generation, has not been able to be given meaningful evidence.

In the coexistence-ist viewpoint, the circulation of knowledge, the circulation of wisdom, alone came to be presented as the principal matter. Without this, deliverance from the clutches of delusion will not be attained. For this very purpose, the beginning of the experiment of universalisation — right from the beginning, the complete study of knowledge, science, and wisdom, the thread for taking decisions, the explanation of possibility — all these things are contained in the alternative proposal. Here

[p. 139]

the matter worth noting is precisely this: the mention of the human body's journey has been on this earth from time immemorial. Jeevan, in itself, exists as the ever-present — in its eternal form, as the conscious unit, in the form of imperishable power and imperishable force. With this favourable circumstance persisting, sequential events kept occurring in the family. First of all, human beings thought of taking refuge in divinity, in God as the doer. The final end of this was the condition of dissolution (*tirobhav*) being one of well-being; for this the entire fabric was woven. As a result of not gaining trust in this, the human being ran toward gathering convenience; on the basis that this did not become available to all, the absence of a point of satiation in this again led to alternative acceptances; in this same sequence, coexistence came to be presented before the human being.

The point worth considering here is just this: a great deal of study has already occurred regarding the prana-cells, regarding the making of the human body-composition. It has also become acceptable to the human being that one has to live with hope, thought, and desire, and with evidence and resolve. This has already come into the natural process. On this very basis we are set upon examining whether it is the human being's body-composition that has changed, or the activity, or the method of knowledge.

The basis of examination will be the human being, and it will indeed be the living human being. From the inspection and examination of the human being's dead body, study occurs of how the balance of these bones, nerves, and muscles remains formed, and what kinds of trouble occur upon its being disturbed. But for the human being to remain balanced, coordination between mentality and body is necessary. Every knower, scientist, specialist, and ordinary human being accepts this. It is mentality alone that manifests and makes clear disease and suffering. To recognise whatever trouble, whatever aberration there is in the body, the deployment of mentality is necessary. Mentality alone is able to recognise everything. In contrast to this, we make the claim that instruments recognise. It is from here that the matter of health came under the subjection of the instrument, whereas the instrument is a produced thing, planned and deployed only by one or more human beings. In this, the human being's mentality remains deployed indeed. Only less than what is planned, according to expectation, does the instrument come to be prepared. We present this matter in this way: if we reckon the purpose of some instrument, by the mathematical method, as 100, then we should place trust in, and make use of, only 75 or less of that. This portion too is regarded as the safety margin of the instrument. Whatever signal is obtained from instruments, it is the human being alone who reads it. Whoever is to read it is able to read it only together with his own mentality; from time immemorial

[p. 140]

it has been believed that trade does not run without dishonesty. If this were indeed the rule, what would the condition of all these enterprises be — this is a matter for research and reflection.

In the second discipline, which is Ayurveda, the Unani method — these are, in their basis, almost one and the same: on the basis of the pulse and the doshas, listening to the throb and the sound of the throb, the attempt to hear the body's voice; on that basis, the inference and acceptance of the body's suffering and aberrations; on that basis, the planning and application of medicines, and placing trust in their success.

From this application, the desired result — that is, the diagnosis of the form of the disease in the condition of becoming healthy — was determined, on the basis of which the medicine was planned; the earning of trust in this process — this sequence was given the name practical-experiential method (*karma-abhyas*).

By the Ayurvedic method, its several methods for recognising the strength of the disease, recognising the medicine accordingly — in the form of forest medicine, in the form of minerals, in the form of medicine obtainable from animals; recognising, by the union-combination-digestion method, the strength of these medicines; using a medicine more powerful than the disease — this itself is what is found to remain disciplined, as practical-experiential method, all the way from recognising the disease to the treatment of the disease. The root matter in this is precisely this: every knower of Ayurveda has need to put in effort. As a result —

recognising diseases — recognising medicines

recognising the strength of diseases — recognising the strength of medicines

recognising diet-restriction — recognising the accompanying vehicle (*anupan*)

— it is those who are able to apply these in combined form that this is called practical-experiential method. It is the whole of this knowledge that, proceeding by the scientific method, is able to reach the accompanying vehicle and diet-restriction, and, on the basis of the fruit and result of this, is able to reach the status of evidence in the form of tradition.

The root matter here is precisely this: after the tradition of the understanding human being, whatever practical-experiential method has been carried out, together with knowledge, science, and wisdom, in the discipline of health and restraint, is found to be functioning, and being transformed, in favour of universalisation. In other language, the tradition of the understanding human being — the glory of the endeavours and commitments of living by the humane method is itself, in the sense of universalisation,

[p. 141]

emerging. The understanding human being, being endowed with knowledge, science, and wisdom by the coexistence-ist method, remains, not as an individualist, but as one endowed with participation, from the family, in universal orderliness and the overall orderliness. It is for this reason that the arrangement of work-behaviour is found to occur only in the sense of undivided society. That is, it was found natural for such an understanding human being to be social, to wish for universal wellbeing, to keep himself propensive toward universal wellbeing, to keep the expectation of being evidenced, and to practise for this. The point worth noting here is that, from the coexistence-ist viewpoint, the understanding human being was seen to be multiply useful. Such a desire is indeed present in every human being. For this reason the possibility of such glory becoming meaningful becomes intelligible.

It is a natural process for the human being, together with understanding, to participate in the discipline of health and restraint. Along with this, it becomes the duty and responsibility of every understanding human being to participate in education-and-culture, justice and security, productive work, and exchange work. Together with understanding, the acceptance of duty and responsibility becomes evidenced in a natural form. After understanding — that is, after being endowed with coexistence-ist knowledge, science, and wisdom — there is no delay at all in accepting responsibility and duty; it becomes evidenced, becomes manifest, by the self-motivated method. All of this has been ascertained through thorough testing and inspection. Every man and woman can verify this through testing; this has been an important inspiration for human tradition.

Every human being is luminous and existent in the combined form of jeevan and body. Every human being lives by taking decisions only on the basis of his own acceptance. At the root of taking such considered decisions is realising the balance of knowledge, science, and wisdom, accepting it, becoming propensive to evidence it, and evidencing it. The sequence and process of evidencing this is found to occur only in the form of participation in the overall orderliness. Such a tradition of evidence is indeed the inspiration, from generation to genera-

tion, for becoming assured and trusted. Such a necessity remains formed, for ever and ever, in human tradition.

On carrying out testing and inspection by the above method, it becomes known that it is on the basis of jeevan that the operation of the body comes about, and not that the operation of jeevan occurs according to the body. This can also be made clear thus: the understanding human being is found operating the body according to his own understanding, and understanding is the human being's boon, right, and supremacy — it is for this reason that understanding is the goal desired by all. The understanding human being is able to present every act, behaviour, and thought only in the sense of undivided society and universal orderliness. As a result of this, jeevan-expectation and human-expectation are able to succeed. It is for this reason that the human goal,

[p. 142]

once recognised, whatever number of work-arrangements come to be, in the sense of its meaningfulness — through the distinctions of done, caused-to-be-done, and approved — the fruit and result of works, in the condition of evidencing the human goal, living within orderliness is natural. It is for this very reason that from the study of the understanding human being it becomes clear that the understanding human being runs the body according to jeevan. In other words, the body is operated on the basis of understanding. Therefore we can trust in this, we can research this: it is only after awakening that the glory of jeevan comes to be evidenced, through the body, within human tradition. This is the flow of resolution for tradition; it is only in the flow of resolution that the glory of human tradition comes to be evidenced in fundamental form. Every understanding human being is indeed desirous of participating in this. Therefore every human being does indeed want to be understanding. In this way, the possibility of universalising the understanding of every human being is fitting.

We have already made clear this point before: that the human being's descent upon this earth occurred only after the material state had become enriched into the prana state, and the prana state into the jeevan state. At the root of this descent, it was made clear that a qualitative change (*gunatmak parivartan*) occurring in the composition-method within the prana-sutra, this change being accomplished by way of a festival, resulted in the human being's descent, according to various countries, times, and circumstances, being accomplished from animal bodies enriched with a medhas-system different from and richer than that of animals. After being accomplished, the fundamental expression in the human being remained precisely imaginativeness and freedom-of-action, distinct from animals. This was so in the primordial human being as well, and remains so even now. In the process of its exercise, whatever knowledge, whatever attainment has occurred in the tradition, has been naturally adopted by the tradition. In this, usefulness has been accepted, and meaninglessness has been left aside. It is by this very method that the research into the human being's imaginativeness and freedom-of-action has kept occurring. By this method, the body-composition remaining as it actually is — that is, however many times it is repeated, or however much it goes on from generation to generation — the form of body-composition, and, at the root of body-composition, the seven metals (elements), their coordination, has kept remaining as it

actually is. On the basis of all these testimonies, even after thousands of years, hundreds of thousands of years have passed, the substance, property, composition-method, limbs, sublimbs, and organs contained in the body remain as they actually are. The medhas-system has always kept clarifying imaginativeness and freedom-of-action through the five sensations, through the five kinds of organs of action. From before, the conception and effort to attain the point of satiation of imaginativeness and freedom-of-action have indeed kept being made. Even now this remains as it actually is. On the basis of this entirely clear condition, the human being has become, in himself, most successful in giving concrete form to ideas according to the definition. The aspect of mental well-being remains, as it actually is, left empty. This itself is

[p. 143]

the important point of today's research. That the desolation of mental well-being should become inhabited — this is the principal matter. The basis of the conception of universal well-being too is just this.

Up to the first decade of this 21st century, the discipline that has been most evidenced for giving concrete form to ideas has, at its root, refinement occurring in the jeevan-natural imaginativeness and freedom-of-action, and not in the body. According to materialism, according to which consciousness is the outcome of body-composition — this has not actually occurred. On this very basis, through great manipulation, in the course of researching change in the body, change in composition, the particularity of body-composition became mangled and got buried under a downpour of questions. Even the Nobel Prize has been determined upon this. This issue was entirely unsuccessful in presenting meaningfulness, evidence, or the possibility of a bright future. From a little while ago, according to the science of body-composition, the number of species of blood became determinate, all the rest having already been determinate before. It also became known that the medhas-system is equal in all human beings. In this, caste, creed, sect, and colour, race, language, country, and time have no interference at all. All these conclusions have proven wrong the notion held by those who thought that consciousness flows according to body-composition. On this very basis, the root assumption of cloning technology is that, by propagating the prana-sutras of some talented person — whom we call talented — an identical body like theirs can be prepared, and identical consciousness too can be prepared. This too has been proven a delusion. Along with this, in the business world, the declaration made by the specialists in cloning technology — 'obtain your own replica' — has also become meaningless. Previously it was believed that from one inch of skin of some good, intelligent person, thousands, lakhs, billions of good men would be prepared; and once prepared, anyone would adopt them as their own children, because everyone wants to make their children intelligent. In this same sequence, endeavour and effort were made and observed; in the experiments carried out so far — those done with sheep, goats, and animals, and those done with humans — it did not turn out to be exactly identical. Partial deviation remained.

On this issue, it is not a very important matter that body-composition, as it repeats by the natural method, should be repeated in this way. Nothing is proven merely by this much.

Because it has been seen that the children of the learned turn out to be fools, and the children of fools turn out to be learned. It is extremely necessary to keep this in mind.

[p. 144]

So long as jeevan-knowledge did not come about, we were ready and compelled to believe that form, property, and culture occur according to lineage. Along with this kind of belief, debate and advocacy of casteist and lineage-ist superiority went on before. All of these have already broken down in today's condition. Brahma-doctrine, self-doctrine, casteism, racism — all these doctrines have already fallen into dispute. As a result, the ring of doubts is becoming ever stronger. The assurance that there was, that consciousness comes to be produced, flows, on the basis of body-composition, has also become disputed. Where is man to go now — this itself is the main issue. From the last decade of the 20th century up to this first decade of the 21st century, an alternative proposal has begun — the coexistence-ist world-view — and the method of study has already been presented, for giving the awareness of the human being as one undivided society, of equality in caste, dharma, understanding — that is, knowledge, science, wisdom — and in jeevan — that is, the conscious unit, equality in imperishable power, in imperishable force, and equality in the nature of awakening.

In this same sequence, there is need to recognise, and need to make meaningful, the uniformity of jeevan-satiation and human-satiation. By this method — that is, from the coexistence-ist viewpoint — the human being exists, is luminous, in the combined form of body and jeevan. In the purport of the whole story told above, there is no development at all occurring in the human body, and none does occur in the body. Whatever glory has been made manifest from the primordial human being up to the most modern human being, this is the expression of the freedom-of-action and imaginativeness found in all humankind — this too has become clear. In researching and investigating the point of satiation of this — that is, in researching and investigating freedom-of-action — it is nothing but the aspiration to become happy; in this same sequence, giving concrete form to ideas became meaningful. This expression of imaginativeness and freedom-of-action is the glory of jeevan, not of the body. Because the body has been accomplished only from the material substance and process of the prana state. This entire composition is prana-cell predominant. These prana-cells cannot be more than their own capacity. Whatever standing became established for human body-composition, it is found to be repeating as it actually is. Freedom-of-action, imaginativeness, mentality, which is found to be seen in all humankind — this mentality, in its root form, is itself one process of jeevan-awakening.

[p. 145]

Among the activities continuously accomplished in jeevan, mind (*mun*) is one activity; the second activity is vritti (thought); the third activity is direct recognition (*sakshatkar*) (chitta), which is deployed for understanding something, for the acceptance of meaning, for the meaning-based acceptance of a thing. For instance, the activity of accepting, together with the word “water,” the substance that is water into existence — this is the chitta activity. In the same way, in buddhi, the activity of enlightenment; the activity of enlightenment is the fitness for accepting certainty and stability — in another language this is the activity of firmly

accepting truth, dharma, and justice. The fifth activity is the activity of realisation. The glory of the activity of realisation is the activity of accepting truth in the form of ever-present resolution, ever-present happiness, peace, contentment, and joy, of evidencing it, and of becoming replete with the assurance that is joy. These five activities are found clearly functioning in the form of the force of jeevan. Realisation alone is evidence. Its fruition is joy. Jeevan is innate (*swatva*); in the process of evidencing this, the human being can be recognised as evidencing, through resolve, through the forming of images in order to project resolve, through analysis in order to make the forming of images meaningful, through selection (the selection of manner-and-method) in order to put analysis into action. By this method these five activities that are projected have been given the name power. This force is called state; the activity that projects it is called motion. In this way, the awakened human being's state-motion comes to be recognised, mutually, on the basis of jeevan activity — that is, on the basis of the state-motion of jeevan. The human being's recognition does not come about at all according to body-composition, nor will it ever. It is for this very reason that we come to pay attention to change in jeevan. The activities of change becoming realised through the principal research and investigation up to today have already become entirely clear. The remaining portion is mental well-being; this can be made meaningful — human-aspiration and jeevan-aspiration — through the entirely clear knowledge, science, and wisdom-fullness that comes from the coexistence-ist viewpoint, together with participation in undivided society and universal orderliness. Every man and woman can present the evidence of this through practice.

3.17 Knowledge, Knower, Known (ज्ञान, ज्ञाता, ज्ञेय)

Darshan [seeing/philosophy] (justice, dharma, truth); *drish* [the seeing] (human jeevan); *drishya* [the seen] (coexistence);

Dhyan [attention] (awakening); *dhyata* [the attender] (the human being); *dhyeya* [the object of attention] (freedom from delusion, jeevan-value, the natural evidence of the human goal);

Karan [cause] (the knowledge-state); *karta* [the doer] (the human being); *karya* [the effect] (wholeness, participation in universality);

[p. 146]

aim (*sadhya*) [the seer-status, awakening]; seeker (*sadhak*) [the human being]; means (*sadhan*) [body and jeevan].

On the issue of knowledge, knower, and known, it has been well-known, or it has been on record, in human tradition, from the distant past, that thinking took place only from the viewpoints of spiritualism (*adhyatmavad*), god-centred-ism (*adhidaivikvad*), and materialism-of-the-beyond (*adhibhautikvad*). The collective naming of these three disciplines has been idealism (*adarshvad*). The point of commonality among these three is precisely mystery. Even what is more than the physical is a mystery. Divinity is, in itself, a mystery; spirituality is, in itself, a mystery. Idealism's root basis-site, and its destination-site, are both mystery. It has been necessary for differences of opinion to arise precisely on the basis of mystery

being the basis, and mystery being the destination. Along with this, effort at practice and exercise by many methods was also made. In whatever ways effort was made in these three disciplines — from exercise, means, yoga, meditation, all the way to worship, recitation, prayer. As the outcome of all these acts, the assurance that was obtained was moksha and heaven; moksha too was a mystery, heaven too was a mystery, and this itself kept being called the destination.

The basis too came to be a mystery in this way. It is from mystery alone, in mystery alone — from the void, from Brahma — that all this creation, sustenance, and dissolution occurred; or, from some substance beyond physical activity, creation, sustenance, and dissolution occurred. In this way the beginning was from mystery, and the end too was from mystery. The end, an auspicious mystery, was from heaven and moksha. Auspicious, because heaven and moksha bring joy; mystery, because its ending occurs in mystery. According to idealism, which is the combined intent of these three kinds — regarding the seen, the seer, and seeing: according to the Brahma-doctrinaires, Brahma alone is the seer, Brahma alone, according to his own resolve, is the seen, and Brahma alone is the seeing-sight that beholds. In the same way the god-centred ones too say — as one gets to read according to the documents — that, according to them, three are propounded: Shakti-knowledge, Shiva-knowledge, and Vishnu-knowledge. In Shakti alone is the entirety of the seen, creation, sustenance, dissolution. In the same way, in all three, this is god-dependent. All that is seen exists precisely because it is, in the form of the seen, the resolve of the gods; the gods alone are the seer, and the one who beholds too is the god. In the same way, according to materialism-of-the-beyond too, it has been said that there is some mysterious seer, seen, and seeing more powerful than the physical. In this same sequence, a statement has also been made regarding knowledge, knower, and known. Brahma alone, or the god, is himself, in the forms of knowledge, knower, and known, attention, attender, and object of attention — all of these. In the forms of effect, cause, and doer too, they are ready to accept God or the god. This has been the tenor of the voice up to now.

[p. 147]

According to materialist thought, difference in consciousness comes to be produced from difference in composition; no evidence of this is to be found. The physical substance alone was taken to be the source of consciousness. In this sequence, nothing is seen from testing stone and soil.

From the coexistence-ist viewpoint, while carrying out the study of the human being's being the combined form of jeevan and body, the situation of jeevan being established in the status of the conscious becomes intelligible. Together with awakening from the awakening-sequence of jeevan, which is of the nature of conscious nature, evidencing awakening within human tradition has to be done. The proximity of body and jeevan is necessary in human tradition, or coexistence is necessary. On the basis of the ten activities occurring in jeevan — namely, realisation, evidence, the enlightenment of realisation and resolve, the direct recognition and forming-of-images of resolve, the comparison and analysis of the forming of images, the tasting and selection of analysis — these ten activities are accomplished in jeevan. It

is these very ten activities that come to be evidenced after jeevan-awakening. So long as the body is taken to be jeevan, only four and a half of the jeevan activities are able to be accomplished; the remaining five and a half activities are not able to be evidenced. It is precisely because of this crisis that the human being becomes tormented. Because of self-contradiction within himself, he is tormented by the crisis of jeevan's powers not being able to be evidenced. In the same way, the delusion of taking the body to be jeevan becomes the cause of problems, and, because of external torment, the human being remains agitated and beset with crisis. The effect of this — treachery, exploitation, war — has forever kept dancing, dominating over the head of the human family. Or, the human being has already come to regard this as unavoidable. What worse picture the human family could present than this is a point worth pondering. Whereas the human being has kept regarding this itself as glory.

By the coexistence-ist method, the study of jeevan and body, and the study of coexistence — the study of jeevan remaining indivisible within coexistence, the entire study of the whole of physical and chemical activities being accomplished within coexistence — has come within grasp. The study of the activities of chemical and physical substances, of the whole of the plant order, the animal order, and human body-compositions being accomplished, becomes accessible. On the basis of the medhas-system in the human body being the most enriched composition of all, jeevan's freedom-of-action and imaginativeness being manifested, thought and reflection, activity, and, on the basis of fruit and result, thought and reflection continuing to occur — now, toward the point of satiation of imaginativeness and freedom-of-action, presented themselves for research and investigation. Because we do indeed want to gain deliverance from treachery, rebellion, exploitation, and war. This is possibly most accepted among the best of men. For this, the need for coexistence-ist study remained.

[p. 148]

According to coexistence-ist thinking, knowledge, knower, and known can be studied precisely. Jeevan was recognised as the knower; as knowledge, coexistence-darshan knowledge, jeevan-knowledge, and the knowledge of humanity-replete conduct were recognised. What is meant by the known is precisely making human-aspiration and jeevan-aspiration meaningful with awakening; it is evidencing the human goal and the jeevan goal through undivided society and universal orderliness — this itself is the evidence of the known becoming meaningful.

In the same way, the meaningful explanation of seer, seen, and seeing also comes about. In the seer-status is jeevan; in the seen-status is existence-as-coexistence; in the sense of seeing, becoming a meaningful explanation in the form of the philosophy of existence comes about.

Attention, attender, and object of attention also become clear in this same sequence. With the object of attention in the form of awakening, attention being accomplished with understanding — in the sense of the sequence for evidencing understanding, the attender is the arrangement for recognising jeevan.

Doer, effect, and cause too are clear. In the doer-status is jeevan; in the effect-status is the human being; the god-human, the divine-human status-establishment; as cause, existence-as-coexistence is the ever-present establishment.

Regarding what used to be thought of in the forms of aim, means, and seeker: from the coexistence-ist viewpoint, the method of recognising the seeker is found to be very easy, and bound up with purpose. From the coexistence-ist viewpoint, the seeker comes to be recognised in the form of the human being. As the aim, jeevan-awakening becomes accessible. It is awakening alone that comes to be recognised in the forms of the human being's innateness, freedom, and right. Such innateness, freedom, and right, in the form of understanding, and such understanding, in the form of knowledge, science, and wisdom — again, innateness, freedom, and right are found to be made glorious. This itself is the evidence of awakening. In this way, how meaningful the aim is — that is, how meaningful awakening as the aim is — every individual can consider. As the means, for research and investigation: imaginativeness, freedom-of-action, evidence in the form of tradition — this itself is the means. When human tradition, as the bearer and carrier of evidence and authenticity — that is, evidence-endowed tradition — becomes able to evidence itself, it is in that very understanding that the evidence of universal orderliness, of undivided society, remains formed. Participating in being evidenced within universal orderliness is itself what keeps evidence universally accessible. It is precisely as a constituent part of universal orderliness that humane education-and-culture is found to become glorious. In human tradition, the glory of universality is found to become meaningful only together with knowledge, education-and-culture. This itself is the meaning of the tradition of evidence. Even so, the general

[p. 149]

survey reveals it to be so — universal, that is, acceptance in all humankind. It was found to be extremely easy for every man and woman to take to heart, to test within oneself, and to determine the meaningfulness or meaninglessness of, the whole row of evidence formed by the coexistence-ist method across all the disciplines of practice, study, work, and behavioural orderliness.

The human being's aim is awakening. Its innateness, freedom, and right take the form of knowledge, science, and wisdom, whose evidence is the form of undivided society, universal orderliness through work-behaviour, which is linked to one another as a chain. In this, no link can be separated. The aim, as it stands in the form of tradition — human-aspiration, jeevan-aspiration — cannot possibly be evidenced without coexistence-ist knowledge, wisdom, and science. It can be evidenced only by the coexistence-ist method. Coexistence is no mystery or struggle. In natural form, it is a thing intelligible to, and illumined from, all humankind. Because every human being does indeed want to live and obtain happiness only in mutuality with someone. By this method the glory of coexistence becomes intelligible.

In the sequence of living together, it is the human being who first appears before one. Such a human being remains accepted only in some relationship or other. First the human being, in the form of the mother, and immediately after, in the form of the father; after this, brother-sister, friend, teacher (*guru*), preceptor (*acharya*), elders, and their likenesses, and in the neighbourhood too, similar relationships remain present in the tradition. In the process of living, nothing other than relationship comes to be clear. It is only on the basis of relationships that mutuality, and recognition and carrying-out in the sense of purposes, are found to

occur. By this method, carrying-out without recognising, and recognising without carrying-out, are simply not possible. In this it becomes known that purpose is our desired attainment. Forming relationships and carrying them out for the sake of purposes is an inevitable condition; this itself we have given the names responsibility and duty. Together with relationships, responsibility and duty being self-motivated, of their own accord, is natural. What duty means is: making sure what to do, how to do it — this is duty. What is to be obtained, how it is to be obtained, ascertaining this and being propensive toward it, is called responsibility. In every relationship, being sure of the fact of what is to be obtained, and ascertaining how, what, is to be done to obtain it — these are links joined to one another. By the self-motivated method, this comes to be carried out in the greatest number of relationships. Of awakening

[p. 150]

alone does such fulfilment become clear. In the deluded condition, the purpose and goal of relationships do not become clear. In deluded tradition, relationships have to be recognised most predominantly on the basis of sensitive tendencies, on the basis of the gathering of convenience, and on the basis of conflict. Human tradition, having endured these very viewpoints from the distant past, has come out desolate in respect of mental well-being.

Whereas, by the coexistence-ist method, the possibility of mental well-being is found to be fitting and accessible for all humankind.

In this same continuity, we are able to recognise all relationships in the sense of meaningfulness, in the sense of purposes, and in the sense of cognisance-replete purpose. Its clear form, in the form of universal orderliness and undivided society; its clear form, human-aspiration and jeevan-aspiration — in the sense of evidences, together with acceptance and together with evaluation, transforming work-behaviour and orderliness and conduct — is itself found to be the fruition of coexistence-ist knowledge, science, and wisdom.

Human-aspiration — the natural evidence of resolution, prosperity, fearlessness, coexistence.

Jeevan-aspiration — is reckoned in the forms of happiness, peace, contentment, joy.

3.18 Seer, Doer, Enjoyer (दृष्टा, कर्त्ता, भोक्ता)

In awakened human tradition, fundamental right is evidenced in the forms of seer, doer, and enjoyer. In most countries, spiritualists have made mentality ready to accept God, the Supreme Soul, Brahma, goddesses, and gods. For this, scriptures too were prepared, and, at the root of all religions, the good sayings written in the scriptures, in the form of divine speech, God's speech, or voice-from-the-sky, came to be accepted. This itself came to be regarded as scripture. On the basis of such a belief, the treatise, and, on the basis of the treatise, the method of preaching became prevalent. Such scriptures came to be prepared at a time when the human beings of one country were not capable of forming relations with all countries. When human beings became so capable, one community became ready to study the religious texts of another. In this it became known that the things which we accept ac-

according to our own religious text, another religious text does not accept. Then where is this divine speech? In this way religious differences of opinion only became more entangled. It is naturally accepted by all that there should be a religious text; along with this, the self-motivated conception also arises in mentality that there should be no dispute in religion; and if a dispute does occur,

[p. 151]

then what indeed became of religion! Human beings who think with such logical intellect do indeed exist upon this earth too. Despite this, what an undisputed religious text ought to be — this has not become available to us by the idealist method. For materialists, there is no need at all for a religious text. In this way we ordinary human beings kept on being tormented — both by internal contradiction, and, in the conflicts of the outer world, by treachery-rebellion, by exploitation, and by the fear of war, we kept on being afflicted. At the root of all these, we have kept believing only in God's grace, the gods' grace; whenever, at any moment, we obtained relief, obtained happiness, on any issue, we took it to be the grace of God, of a god, or of a guru. In this way we ordinary human beings kept enduring joy and sorrow. Trust in oneself was found neither with those called ordinary, nor with those called special. Whereas the matter of obtaining relief on the basis of trust has kept coming to be recognised in every human being. It is still the same even now. It is in whatever mutualities we are able to trust that we find relief — whether this be a moment, a day, or a year. Taking this itself to be God, a god, or a guru's grace, we keep engaging, for ever and ever, in the work of deceiving ourselves. Whereas it is by force of his own imaginativeness and freedom-of-action alone that the human being has succeeded upon this earth in giving concrete form to his own ideas. If this is not the produce of the human being himself, then whose produce is it? Whether we understand this or not, it is a necessary matter to be thought about. Along with this, it is precisely evidencing mental well-being that is resolution within human tradition.

The matter to which attention needs to be paid here is just this: whatever is reflected before us — is there, at its root, any doer-status or not, is there one who does or not? If, at its root, there is no doer, then the ascription of the status of universal-doer became wrong. If there is no doer, then what would the enjoyer-status be like? If this is not so, then what became of the seer-status? All these questions have kept arising one after another. The answer to these questions is not to be found by the idealist method.

When, by the coexistence-ist method, thinking and reflection began, and decisions began to be recognised, then it became known that whatever is functioning, in coexistence, in the form of the four states, all of it is indeed itself in the self-motivated doer-status. For this reason, activity, in itself, is clearly functioning in the sense of the developmental sequence in the forms of effort, motion, and result. In this same sequence, awakening was recognised in the forms of the immortality of result, the repose of effort, and the destination of motion. It has become possible to recognise the immortal status of result in the sense of development, the repose of effort, and the destination of motion, as awakening and awakening-completeness. In this way the human being himself becomes the knower of the awakening-status,

[p. 152]

the herald (*udghata*), or the unit worthy of evidencing — this becomes intelligible. From all the above study it became clear that, within coexistence — that is, within the pervasive substance — all single substances remain conjoined, and, by force of being endowed with energy and endowed with force, become functional by the self-motivated method; it was found that there is no need at all for anyone to make this happen. It was seen that all compositions, from the very smallest to the very largest, remain functional in themselves. It became intelligible that such functionality itself, in the forms of effort, motion, and result, is precisely what came to be known, in the developmental sequence, as the immortality of result from the developed status. The testimony of this is precisely the constitutionally complete atom-status, which is itself the conscious status.

In the developmental sequence, the doer-status was clear. In the conscious status, in the sequence of awakening, in the combined form of jeevan and body, the hope, thought, and desire to live, in the animal order and in deluded human tradition, became clear. In making clear the hope to live, wanting and not-wanting came to be evidenced. Along with this, in the form of wanting — that is, together with the wanting to live — the wanting to be happy came to be manifested from the human being. For this, giving concrete form to ideas became possible. From this it becomes entirely clear that the mentality of wanting to be happy manifested itself in the human being in the form of his own desire. On the basis of this, the doer-status having already existed, the expectation of the enjoyer-status arose, the expectation of enjoying happiness arose. For this, the rise of the seer-status became inevitable. Such an establishment of the seer-status is itself the evidence of understanding.

Understanding itself was found to become the seer-status, established as the knower together with the knowledge-element. By this method it is the human being alone who evidences the doer, enjoyer, and seer statuses. The human being is found to remain made glorious only in the combined form of jeevan and body. The glory of the conscious unit is precisely the attainment of the seer- and knower-status. As a result, in the sense of evidencing, evidencing himself within human tradition, the human being is found to be made glorious in the doer- and enjoyer-status. In this way it became clear that the physical, chemical world is in the self-motivated doer-status, while the conscious status, jeevan, together with its being endowed with awakening, was found to be in the form of seer and knower. As seer and knower, the utility, well-utility, and purposeful deployment of the doer-status gives rise to the good fortune of evidencing jeevan-aspiration and human-aspiration. In contrast to this, remaining deluded leads to affliction through problems. As far as the chemical, physical world is concerned, this has become clear on the basis of resultant-fruitition within the actual condition, in the developmental sequence. In this way, the enjoyer-status has come to be formed together with the doer-status. Because the form of the result is seen in many actual conditions. To see means precisely to understand. Understanding is found to be the entire glory and grandeur present in jeevan. In this way, in the conscious world, the establishment of the seer-status becomes linked

[p. 153]

to this. This became clear as a result of awakening. This itself is the main matter. In the whole of chemical and physical activity, in the animal order, and in the deluded human being, testimony to being doer and enjoyer has forever remained formed. For this very reason, it is precisely together with the seer-status that the human being, as doer, has the arrangement for becoming meaningfully successful — not in the deluded condition. So be it: it is natural for the seer-status to be the glory of awakened tradition alone. Therefore, keeping human tradition intact is, for all of us human beings, the all-auspicious thread, the all-auspicious explanation.

Nityam yātu śubhodayam [May auspicious dawn come forever]
