

Why Humans Are Not Just Material

Author: AnalyticMadhyasthDarshan.org — a group of people studying Madhyasth Darshan philosophy. Source repository: [raghavamohan/AnalyticMadhyasthDarshan](https://raghavamohan.com/AnalyticMadhyasthDarshan).

Edited on: June 29, 2026, 3:55 AM IST

The question: Is a human being nothing more than a physical–chemical body, or is there something real about us that matter-centric science cannot capture?

This document gives three answers to that question — from **Madhyasth Darshan** (Shri A. Nagraj's Co-existentialism), from **mainstream science**, and from **Advaita Vedanta** — then compares them and critically reviews all three.

Standpoint and scope

These studies are written from the standpoint of a **scientist and technologist** — someone trained to graduate-level **physics and mathematics**, at home with contemporary cosmology, quantum theory, conservation laws, and the logic of formal models.

From that background, a familiar picture of nature is hard to avoid: **consciousness appears as something the brain does** — an epiphenomenon, functional outcome, or emergent property of particular configurations of very large numbers of physical particles. Modern physics and cognitive science are powerful on mechanism, prediction, and public evidence; yet the hard problem of consciousness, the status of the self, and the reality of value remain fiercely contested. The standpoint taken here does not treat those gaps as settled in favour of matter-only reductionism.

The work begins where that scientific picture leaves open questions — and asks whether Madhyasth Darshan offers a coherent alternative worth examining seriously. This paper reads the primary texts carefully, states what follows from the darshan itself, and compares it in parallel with what we know from **physics and the natural sciences**, **Advaita Vedanta**, and **modern Western philosophy** (especially philosophy of mind and moral science). Physics and mathematics are **one leg** of that comparison, not the only one. The aim is rigorous comparative understanding — testing definitions, internal consistency, and fit with public knowledge — not persuasion or devotional endorsement.

These topical studies state the philosophy in clear, checkable prose first. A separate formal mathematical treatment may follow once the definitions and relations are stable across the studies; this paper does not assume or require that treatment.

1. The Madhyasth Darshan Answer

Madhyasth Darshan holds that a human is not only a body but **body + jeevan** — a real, sentient self that works through the body — so humans cannot be fully explained by matter-centric science alone.

“Existence is not just physicochemical matter, but all physical, chemical and *jeevan* entities are inseparably present in Omnipresence.”

— MVD, *The Alternative*, point 7

The texts develop that answer in two steps: first the **ontological** argument (§1.2); then **phenomenological** confirmation from lived experience (§1.3).

1.1 A fresh starting point

Shri. Nagraj begins by rejecting two inherited pictures. Science studied the human as a clever animal; mysticism declared the truth an unknowable mystery. Neither actually studied the human being, so a fresh starting point is needed.

“Both of these ideologies have considered the human being as an animal.”

— MVD, *The Alternative*, point 1

1.2 The ontological argument

Madhyasth Darshan argues first from what exists: the orders of nature, what *jeevan* is, how body and sentient self form a human, and what the knowledge order adds. Five steps carry that argument.

1.2.1 The four orders of nature

Nature has four levels — material, biological, animal, and knowledge. Each higher order contains the lower ones. Humans belong to the fourth, the **knowledge order**, whose essential nature is “fortitude, courage, generosity, kindness, grace, and compassion” and whose purpose (*dharma*) is happiness (MVD, Ch. 3).

Sentience is not spread across all matter on this reading. Material and biological orders are insentient (*jada*): they integrate, grow, and vitalise, but have no hope to live. **Hope to live** (*jeene ki aasha*) enters at the **animal** order — the threshold where a constitutionally complete sentient unit appears as *jeevan* ([The Ontology of Coexistence](#) §1.5). In the **knowledge** order the same *jeevan* works through a human body as **joint form** — body and sentient self together, not reducible to either alone (MVD, p. 13; §1.2.3).

1.2.2 Sentience as developed matter

With the orders in view, the sentient unit itself is not a second substance added from outside matter. Development is built into existence (effort → motion → result). An atom that becomes constitutionally complete (*gathanpurnata*) crosses irreversibly into sentient status — and that sentient atom is the *jeevan*. On Madhyasth Darshan’s reading, sentience is **latency actualized** at constitutional completeness — ever-present intelligibility in coexistence reaching active sentience through a stable atomic configuration, not strong emergence from wholly non-experiential matter. At T1, hope-bondage replaces molecular- and weight-bondage (MVD, p. 91). Post-death continuity of *jeevan* is a **separate** commitment from coexistence conservation: configurations begin and end; *jeevan* persistence is in-

ferred from constitutional immortality together with conservation — not from phenomenology alone. For the emergence tension, conservation ontology, mereology of *jeevan*, and identity across death, see [The Ontology of Coexistence](#) §§1.8–1.12 and §6.2.

“Nothing arrives at birth nor does anything depart with death. All that is, exists forever. Jeevan continues to exist even after death as it does while driving a body.”

— JV, Ch. 1

1.2.3 Body and self are not the same

Given what *jeevan* is (§1.2.2), a human is not the body alone but a **joint form** of body and sentient self. The central argument is that the body and *jeevan* have different jobs: eating and sleeping serve the body; values and evaluation serve *jeevan*. When the body sleeps, *jeevan* does not. Different jobs mean they are not the same thing. Within Madhyasth Darshan, mistaking the body for the self is **delusion on the delusional plane** — body-identified life while *jeevan* is already present — not absence of a sentient unit ([The Ontology of Coexistence](#) §1.10; [Knowledge, Knower, and Known](#) §1.10).

“The body is not *jeevan*, and *jeevan* is not the body. Jeevan is eternal, and the body is merely a vehicle and medium for *jeevan*.”

— SB, Ch. 7

1.2.4 Knowledge in the human order

Once body and *jeevan* are distinguished, the knowledge order’s unique epistemic work is to understand, evaluate, and responsibly use all of nature. Humans alone do this: nothing else on Earth knows the properties, nature, and purpose of everything else (MVD, Ch. 4). The **unfolding of knowledge** (*gyan udghatan*) — turning what is given into lived understanding — occurs only through awakened *jeevan*, not through the brain, insentient matter, or Omnipresence acting as knower (MVD, pp. 115–116, 289; [Knowledge, Knower, and Known](#) §1.1).

Awakening in the knowledge order requires a human body with enriched nervous system and imagination (MVD, p. 115; JV, pp. 79, 93). MVD p. 115 describes vibrational motion on the brain from the cognitive organs leading to the unfolding of knowledge — motion **within** the human as joint form, not generation of sentience by neural tissue alone. The brain (*medhas*) receives and processes signals related to *jeevan*’s aspirations, desires, and evidence (MVD, p. 83); values and evaluation are *jeevan*’s activities, not bodily or mechanical processes (JV, p. 39); and the body is provisioned to **evidence** understanding in conduct, not merely house brain activity (JV, p. 59). Sentience is therefore not a property the brain produces; the brain is the **medium** through which *jeevan* in the knowledge order expresses thought, realization, and evidenced conduct. Full joint-form causation is developed in [Knowledge, Knower, and Known](#) §1.12.1 and [The Ontology of Coexistence](#) §6.2.5.

1.2.5 The wisdom layer

When *jeevan* **awakens** in the knowledge order, the texts describe functional layers through which it works. Awakened humans express five functional layers (*koshas*); the fifth — *vigyanmaya*, the wisdom layer — enables knowledge, wisdom, and science. Animals have four; matter has two (MVD, Ch. 3). The finer structure of *mun*, *vritti*, *chitta*, *buddhi*, and *atma* within *jeevan* is reserved for the ongoing study *Philosophy-Of-Mind-And-Jeevan*.

1.3 The phenomenological argument

The ontology in §1.2 argues from what exists. Shri. Nagraj also argues **phenomenologically**: from how being human actually *feels from the inside*. If you attend to your own lived experience, you will find things in it that a purely material being should not have. Four observations carry this argument.

1.3.1 Two kinds of fulfilment are experienced, not inferred

Everyone knows from the inside the difference between satisfying the body and satisfying *oneself*. The same split stated ontologically in §1.2.3 is available to inward inspection here. A full stomach and a good night's sleep complete the body's needs — yet a person can be fed, rested, and healthy and still feel entirely unfulfilled. Conversely, a person can be tired and hungry yet deeply content because they acted justly or were trusted by someone. The two satisfactions do not substitute for each other, and we never confuse them in experience. Shri. Nagraj reads this directly off lived life:

“Activities such as eating and sleeping serve the body’s needs, while values and evaluation serve *jeevan*’s purpose. Mere sustenance of the body does not equate to *jeevan*’s fulfilment.”

— SB, Ch. 7

If the human were body alone, bodily completion should be human completion. Experience says it is not. The texts read this split against six built-in **perspectives** (*drishti*): pleasant–unpleasant, healthy–unhealthy, and profit–loss orient the lower refuge; justice, dharma, and truth orient the humane refuge when awakening opens ([The Ontology of Coexistence](#) §1.10.5).

1.3.2 The wanting never stops at the body’s limit

A material system needs only what maintains it. But human desire is experienced as *unlimited* in a specific direction: we do not want pleasure occasionally, we want happiness **continuously** — and no quantity of consumption, comfort, or sensation ever delivers continuity. Sensory pleasure is episodic by its nature (it fades as the sensation fades), yet the demand it fails to meet does not fade. Shri. Nagraj takes this mismatch — a body-sized supply chasing a more-than-body-sized demand — as the felt signature of *jeevan* in everyday life. The same mismatch shows up in what we *produce*:

“It is clear that whatever *jeevan* does through the body, the result of it always turns out to be more than the needs of the body. It is a natural process. I have seen *jeevan*, and I have seen humans as a combined form of *jeevan* and body.”

— JV, Ch. 1

Humans grow more food than they can eat, build more than they can inhabit, and create art, mathematics, and philosophy that feed no cell. Animals do none of this. Something in us aims past the body’s needs — and we *experience* that aiming. The demand for continuous happiness aligns with four *jeevan* values — happiness, peace, contentment, and bliss — as harmonies within the sentient unit, not satisfactions the body could complete on its own (JV, p. 138; [The Ontology of Coexistence](#) §1.10.6). Much of ordinary life runs in **sensitivity** alone — bodily responsiveness to pleasure, health, and gain — while **comprehension** (*jeevan*’s grasp of relationship and order) remains underdeveloped (JV, p. 166; [Knowledge, Knower, and Known](#) §1.9).

1.3.3 Experience presents a self that the body’s states do not exhaust

When the body sleeps, something still dreams, and something registers rest on waking. When the body ages, the sense of “I” does not feel older in the same way the knees do. We say “my body” the way we say “my house” — experience spontaneously presents the body as *had*, not as *been*:

“We end up believing that *jeevan* sleeps, whereas, in reality, sleep is merely an activity of the body.”

— SB, Ch. 7

Shri. Nagraj’s point is not that this grammar proves dualism, but that the *deluded* position is the learned one: identifying with the body has to be argued into us, while the felt distinction between self and body is the default datum of experience.

1.3.4 The moral demand is felt from the start, before any teaching

Justice, truth, and right conduct are not experienced as preferences we acquired but as demands we *recognise* — and children recognise them before anyone trains them (for comparative moral psychology, see [Ethics-And-Morals-In-Human-Beings](#)):

“From the time of birth, a human being inherently seeks justice, desires to act correctly, and speaks the truth. This is the natural state of a child.”

— SB, Ch. 1

A child protests unfairness long before it can defend the concept. For Shri. Nagraj this is the knowledge order showing itself: the orientation toward justice is part of what a human *is*, not part of what a human is taught. In MD’s taxonomy, that innate orientation is the humane refuge — *nyaya*, *dharma*, and *satya* — built into *jeevan*’s design, not merely learned preference ([The Ontology of Coexistence](#) §1.10.5).

Put together, lived experience contains a second kind of fulfilment, a more-than-bodily wanting, a self presented as distinct from its body, and an unlearned moral demand. None of these is detected by instruments; all of them are available to anyone who looks inward. Shri. Nagraj's conclusion is that the materialist account does not merely fail in the laboratory — it fails *in the first person*, every day, in everyone. Even its defenders feel the failure:

“Scientists have unsuccessfully attempted to describe humans as machines. The scientists who describe humans as machines themselves remain dissatisfied with that description.”

— JV, Ch. 1

Phenomenology shows how things *seem*, and seeming can mislead — the materialist will reply that every one of these experiences is itself produced by the brain (§2.3), and §5.1 weighs whether felt distinctions can carry ontological weight. But within Madhyasth Darshan, this argument has a special status: it is the one line of evidence every reader can check without instruments, scriptures, or laboratories — which is exactly why Shri. Nagraj's proposed test in §1.4 begins with self-verification.

1.4 The proposed test

Shri. Nagraj does not ask for belief on authority. He proposes: **study** existence, *jeevan*, and humane conduct; **verify in yourself**; and **evidence it in behaviour** — the ability to live and impart understanding is the criterion of wisdom (MVD, *The Alternative*, point 5).

MVD names the evidence chain **Realisation – Behaviour – Experiment** (MVD, p. 12): realization is ultimate evidence only when it becomes manifest in resolution, work, and conduct — and conduct closes as **authentic proof** (*pramanikta*) when understanding can be conveyed to another (JV, p. 26; [Knowledge, Knower, and Known](#) §§1.6–1.8).

In Madhyasth Darshan, study is only the starting point. True understanding is fulfilled when what is studied becomes clear in one's own seeing, stable in conviction, and evident in conduct — recognition of relationships, fulfilment of values, resolution in thought, responsible work and experiment, and the ability to convey the understanding to others.

Whether conduct-based criteria can discriminate awakened practitioners from controls in a pre-registered, inter-subjective test remains unsettled; §5.4 flags what would count as evidence either way.

1.5 What makes this answer distinctive

Matter is not denied or demoted; it is *promoted*. Sentience is what matter itself becomes when fully developed. So the human is two real things in one real world: a material body and a developed-material *jeevan*, coexisting.

2. The Scientific Point of View

Mainstream science answers that a human is an organism — a body with an extraordinarily complex nervous system shaped by evolution and culture — and that mind is what the brain *does*, not a second

entity. Science develops that answer in the same sequence as §1: first what its ontology allows, then how it reads first-person experience, then what counts as evidence.

2.1 A familiar starting point

From science's side, the default picture is familiar: the human is a **clever animal** — an evolved organism whose behaviour, including valuation and self-awareness, is studied through biology, neuroscience, and psychology. Methodological naturalism treats public measurement and replication as the working standard; it does not require denying that experience feels real, only that explaining it starts from organised matter rather than a second substance.

2.2 The ontological reply

Science replies to Madhyasth Darshan's ontological argument (§1.2) by denying categorical orders, a constitutional sentient atom, and any entity over and above brain-and-body organisation. Five lines of reply parallel the five ontological steps.

2.2.1 Continuity, not four orders

Evolution and developmental biology describe **gradients of complexity**, not the four discrete orders Madhyasth Darshan names. Life, nervous systems, and human cognition arise through incremental change; there is no separate threshold where “hope to live” enters as a new kind of entity. Sentience, on the scientific reading, tracks **neural organisation and behaviour** — not an animal-order plateau followed by a knowledge-order joint form (§1.2.1).

2.2.2 Mind emerges from organisation

Consciousness, valuation, and justice-seeking are properties of how matter is *organised* (brains, bodies, societies), not properties of any particle (Dennett 1991; Churchland 1986). Destroy the organisation — brain death — and the phenomena cease, while the atoms remain exactly what they were. There is no constitutionally complete sentient atom and nothing that survives death intact as a unit separate from the dissolving body (§1.2.2).

2.2.3 No second entity — and no interaction gap

Every capacity attributed to *jeevan* — values, evaluation, the feeling of being a self — correlates with neural and social processes that neuroscience and psychology already study (Kandel et al. 2021). No instrument detects a sentient unit separate from brain activity. Occam's razor says: do not posit a new substance when structured matter plus culture explains the data.

If a separate self “drives” the body, there must be a junction where its intention becomes muscle motion. Physiology finds no such junction: every movement traces back through neurons obeying ordinary physics, with no detected inflow of energy or information from a second entity. This has been the standard objection to every body/soul dualism since Princess Elisabeth posed it to Descartes in 1643 (Shapiro 2007); its modern form is the causal-closure argument (Kim 2005).

From a physics standpoint, the objection is sharper than a philosophical puzzle about “where mind meets body.” If *jeevan* steers the nervous system, that steering must either inject energy into a closed physical system — violating conservation in any locally closed region where neural dynamics are well modeled — or rearrange existing energy and information without leaving a detectable surplus or deficit in the causal budget. Brain–machine interfaces and motor neuroscience already track intention-linked neural activity down to synaptic and ionic scales (Kandel et al. 2021); no reproducible anomaly has been found where muscle motion requires physics beyond the brain’s own energy budget. That does not prove *jeevan* is absent, but it sets a high bar: any interacting *jeevan* must be either causally inert (and then it does not “drive” the body) or physically efficacious in a way that should, in principle, show up as a measurable departure from closed physical prediction. Madhyasth Darshan’s non-Cartesian reading models the human as a **joint form** in which *jeevan* coordinates through state and order transmission within effort–motion–result — not joule injection from outside — though whether that satisfies Kim-style causal closure remains open ([Knowledge, Knower, and Known](#) §1.12.1; [The Ontology of Coexistence](#) §6.2.5). For how Madhyasth Darshan frames conservation, constitutional completeness, and the *jeevan*–body interaction as open problems, see [The Ontology of Coexistence](#) §1.8 and §6.2.

2.2.4 Cognition, culture, and the brain

Humans genuinely differ from animals — in symbol use, language, cumulative culture, and moral reasoning (Tomasello 2014). But “unique” is not “non-physical.” What Madhyasth Darshan attributes to the knowledge order — evaluating and using all of nature — science reads as **what brains plus cumulative culture do**: symbolic representation, shared attention, and transmission of understanding across generations. Mind here is not a second knower; it is the functional output of neural tissue embedded in social learning (§1.2.4).

2.2.5 Layered function, not *koshas*

Neuroscience likewise describes **layered function** — sensory, motor, integrative, and executive circuits — without positing Madhyasth Darshan’s *koshas* or a separate wisdom faculty. Higher cognition is distributed across cortical and subcortical systems that coordinate planning, memory, and evaluation (Kandel et al. 2021). The parallel to §1.2.5 is structural, not metaphysical: science explains differentiated mental capacities as organisation within one nervous system, not as awakening layers of a sentient atom.

2.3 The phenomenological reply

Science does not dismiss first-person experience; it treats the data Shri. Nagraj cites in §1.3 as **real but brain-mediated**. The felt distinctions do not require a second entity — they are what organised neural processing feels like from the inside (Dennett 1991; Churchland 1986).

2.3.1 Fulfilment is still brain-mediated

The difference between bodily satisfaction and a sense of meaningful fulfilment is experienced sharply, but both ride on the same nervous system. Reward, valuation, and the feeling that “I” am content when acting justly are cortical and subcortical processes neuroscience already maps — not proof that a non-body satisfier exists alongside the body (§1.3.1; Kandel et al. 2021).

2.3.2 Unlimited wanting has material explanations

The demand for continuous happiness outruns episodic pleasure because **motivational systems** are built for pursuit, not permanent satiation — hedonic adaptation, dopamine dynamics, and evolutionary mismatch between ancestral scarcity and modern abundance explain the gap without positing a more-than-body want (§1.3.2). Humans produce beyond bodily need because culture and symbolic planning extend appetite; animals lack that cumulative infrastructure, not because they lack *jeevan*.

2.3.3 The felt self is constructed

Sleep, dreaming, and the sense that “my body” is possessed rather than identical with “me” are genuine experiential data — but neuroscience treats them as features of **narrative self-modeling** and altered brain states during sleep, not as direct intuition of a non-body self (§1.3.3). Cartesian grammar alone does not establish dualism; it reports how a brain represents its own embodiment.

2.3.4 Moral beginnings without *jeevan*

Children’s fairness-seeking and early truth-telling are real and developmentally striking — but are well explained by evolved cooperation, social learning, and early moral psychology (Bloom 2013), not by an innate knowledge-order orientation requiring a separate sentient unit (§1.3.4). See also [Ethics-And-Morals-In-Human-Beings](#) for a fuller comparative treatment.

2.4 Public evidence, not private realisation

Shri. Nagraj’s warrant is his own *samadhi* realisation. Science requires inter-subjective verification: claims anyone can check, predictions that could fail (Popper 1959). That standard parallels §1.4’s demand for evidence in conduct — but restricts what counts as proof to what observers can independently test.

2.5 What science leaves open

Science explains the *functions* of mind increasingly well, but the **hard problem of consciousness** — why physical processing is accompanied by felt experience at all — remains unsolved (Chalmers 1995; Nagel 1974). Some respected philosophers take seriously the idea that consciousness belongs to matter’s fundamental nature — panpsychism (Strawson 2006; Goff 2019). So “sentience in matter” is not a lone mystic’s idea — but no version of it is established science, and none claims the conscious unit survives death intact. Madhyasth Darshan distinguishes the Hard Problem from ***rahasyata*** (mysteriousness): mystery names removable deficit in the knower’s reflection, not a permanent opacity of nature — a different epistemic commitment from leaving consciousness explanatorily open

([Knowledge, Knower, and Known](#) §§1.11, 3.4). Science does not demote matter or promote a second substance; it explains function from organisation while leaving the deepest why-of-experience unsettled — the mirror image of §1.5’s claim that sentience is matter fully developed.

3. The Advaita Vedanta Answer

Advaita Vedanta answers that you are not material because, at the deepest level, you are not even an individual — the true Self (*Atman*) is identical with the one ultimate reality (*Brahman*), and the material world itself is a dependent appearance (*mithya*). Advaita develops that answer in the same sequence as §§1–2: a starting point, an ontological case, a phenomenological case, a method of knowing, and what makes the position distinctive.

3.1 A different starting point

Advaita enters where §§1–2 leave the body-only picture unsatisfying but disagree on what remains. Against **materialism** (§2), it holds that consciousness is the one datum experience cannot step outside of — so explaining the human cannot start by treating mind as a late product of insentient matter. Against **Madhyasth Darshan** (§1), it accepts that you are not the body alone, yet denies that the inner functionary Shri. Nagraj affirms (*jeevan* — desiring, deciding, developing) is the final self. Whatever can be observed, including that inner life, is still an object *to* awareness. The Advaita starting point is therefore **witness-consciousness first**: not a clever animal (§2.1), not body plus sentient atom (§1.2), but the irreducible seer presupposed in every experience.

3.2 The ontological argument

From that starting point, Advaita builds an ontology in which only *Brahman* is ultimately real, the person is appearance, and the question “Is the human just material?” is misposed. Three steps carry that argument.

3.2.1 Brahman alone is real; the world is appearance

Advaita Vedanta holds the famous formula *Brahma satyam, jagat mithya* — Brahman alone is real; the world is appearance (VC, v. 20). MVD itself summarises the position:

“According to Vedanta knowledge, only Brahman is the truth, and this world is an illusion (*‘Brahma satya, jagat mithya’*). However, jeeva and jagat are said to have originated from Brahman.”

— MVD, *The Alternative*

On this reading, material nature is not denied as everyday fact but is not **ultimately** real: it depends on Brahman as appearance (*mithya*), unlike Madhyasth Darshan’s perpetual world (§1.5) or science’s sole reality (§2.5).

3.2.2 You are not the body — or the mind

Advaita peels away every layer that can be observed: the body, the senses, the mind, even the sense of “I”. Whatever you can observe cannot be the observer (DDV, v. 1). What remains is pure witness-consciousness — *Atman* — which was never born, never changes, and never dies (KU 1.2.18; BG 2.20). This agrees with §1.2.3 that the body is not the self, but cuts deeper than joint form: the working mind and felt inner agent are also not-self.

3.2.3 The self is not individual; the question dissolves

The apparent separate person (*jiva*) is a provisional appearance caused by ignorance (*avidya*) — the superimposition (*adhyasa*) of self on not-self analysed in the preamble to Shankara’s *Brahma Sutra Bhashya* (BSB, *Adhyasa Bhashya*). Liberation (*moksha*) is not gaining anything new — it is recognising that the Self was always already Brahman: one, complete, without a second (CU 6.2.1, *tat tvam asi* at 6.8.7). “Is the human just material?” assumes a separate human in an independent material world. Advaita answers: ultimately there is no separate human and no independent material world; there is only Brahman, appearing as both — so the question **dissolves** rather than receiving a body-plus-soul answer.

3.3 The phenomenological argument

Advaita does not rest its case on scripture alone. Like Madhyasth Darshan (§1.3), it has a first-person route — older and more systematic — built on **neti neti** (“not this, not this,” BU 2.3.6): turn attention inward and *negate* everything that presents itself as an object, because whatever you can observe cannot be you, the observer. Four observations parallel those in §1.3; science reads the same data as brain-mediated (§2.3), while Advaita reads them as pointers to the witness.

3.3.1 Two kinds of fulfilment are witnessed, not the Self

Everyone knows from the inside the difference between satisfying the body and satisfying oneself (§1.3.1). Advaita agrees the distinction is real in experience — and adds that **both** satisfactions are witnessed: hunger eased, justice felt, contentment after right action — each appears *to* awareness and is therefore “not this.” Science treats both as neural process (§2.3.1); Madhyasth Darshan treats the second as *jeevan*’s fulfilment (§1.2.3). Advaita treats neither as the Self (*Atman*), which cannot be an object of experience (DDV, vv. 1–5).

3.3.2 Unlimited wanting is witnessed; the witness does not want

Human desire outruns bodily need (§1.3.2). Advaita does not deny the mismatch; it locates wanting, planning, and the demand for continuous happiness among the **movements of mind** that appear to awareness. The witness that knows desire is not itself desiring — so the more-than-body demand, however deeply felt, is still “not this” (§2.3.2 explains the same datum materially through motivational systems and culture). Where Shri. Nagraj finds *jeevan*’s signature in that demand, Advaita finds another layer to negate.

3.3.3 Experience presents a self the body's states do not exhaust

When the body sleeps, something still dreams, and something registers rest on waking (§1.3.3). Advaita uses waking, dreaming, and deep sleep — the analysis of the Mandukya Upanishad (MU, vv. 3–7) — to push further than body/self distinction. In dreams, consciousness is vividly present while the physical body lies inert. In deep sleep even the mind subsides, yet something persists: on waking you say “I slept well,” reporting an experience of peaceful absence (VC, v. 120). That which witnessed even the mind's absence cannot *be* the mind. Where Shri. Nagraj concludes “*jeevan* does not sleep,” Advaita concludes the witness is beyond even the sleeping mind. Science reads sleep and self-modeling as brain states (§2.3.3).

You see the body — its hands, its ageing, its pain — so the body is an object *to* you. The same negation cuts through sensations, emotions, thoughts, even the feeling of being “me”: each is witnessed, so each is “not this.” What can never be negated is the witnessing itself — for even the act of doubting it is witnessed.

3.3.4 The moral demand and the five sheaths

Justice, truth, and right conduct are felt from the start (§1.3.4). Advaita does not treat them as proof of a separate knowledge-order entity; they arise within the **appearance** of personhood and can orient life toward liberation — yet ethics on this path is preparatory, not ultimate (§5.3). The Taittiriya Upanishad walks attention through five layers — the food-body (*annamaya*), vitality (*pranamaya*), mind (*manomaya*), intellect (*vijnanamaya*), and bliss (*anandamaya*) — discovering each to be a *sheath* the Self wears, not the Self (TU 2.1–2.5; elaborated in VC, vv. 154–212). These are the very *koshas* Shri. Nagraj affirms as functional equipment when *jeevan* awakens (§1.2.5); Advaita **negates** them progressively to reveal the Self beyond all layers. Science maps layered function to neural architecture without either move (§2.2.5).

What survives all these negations is not nothing — it is the constant, self-evident awareness in which body, mind, and world appear. Advaita's claim is that this awareness is not a *property* of you; it *is* you (*Atman*), and analysis shows it cannot be material: it is never an object, has no parts, and is presupposed by every observation, including every scientific one.

Both Madhyasth Darshan and Advaita begin from the same first-person data — the felt distinction between self and body, the sleep observation in §1.3.3. They stop at different stations: Shri. Nagraj negates only the body and *affirms* the inner functionary he finds (*jeevan*); Advaita keeps negating *through* the inner functionary too, until only the actionless witness remains. To Advaita, Shri. Nagraj stopped too early — *jeevan*'s desires and decisions are still observable, hence still “not this.” To Shri. Nagraj, Advaita negated too far — dissolving the real, working self into a featureless witness and the real world along with it.

3.4 Scripture, reason, and meditation

Advaita's warrant is not private realisation alone (contrast §1.4 and §2.4). The classical path is hearing the scriptures (*shravana*), reasoning over them (*manana*), and sustained meditation (*nididhyasana*), under a qualified teacher (BU 2.4.5). *Neti neti* is both phenomenological method (§3.3) and contem-

plative discipline: the final truth outruns positive language and is pointed to by negation (BU 2.3.6). Unlike Shri. Nagraj’s **Realisation – Behaviour – Experiment** chain, which closes in conduct others can observe (§1.4), and unlike science’s demand for inter-subjective test (§2.4), Advaita treats liberating insight as confirmed within a scriptural and contemplative lineage — a different epistemic standard, not a duplicate of public experiment.

3.5 What makes this answer distinctive

Where Shri. Nagraj defends the reality of *both* matter and self, Advaita is the most radical anti-materialism possible: matter is not part of the answer because matter is not finally real. The human is “not just material” because nothing is. Consciousness is not emergent (§2.5), nor a developed atom (§1.2.2), but what ultimately **is** — one Self without a second, appearing as many. That rigor purchases a steep price: the everyday world, individual relationships, and the body-only/material debates of §§1–2 are real only provisionally from the highest standpoint — which is why Shri. Nagraj’s middle path insists on a perpetual world and many real *jeevan* units (§4.1).

4. Comparing the Three Views

Question	Scientific materialism	Madhyasth Darshan	Advaita Vedanta
What is a human?	An organism: body + brain + culture	Body + <i>jeevan</i> (a real sentient unit)	Ultimately <i>Atman</i> = <i>Brahman</i> ; the person is an appearance
Is the world real?	Yes — and it is all there is	Yes — real and perpetual	Only provisionally; finally <i>mithya</i>
What is consciousness?	Emergent brain process	The nature of a fully developed atom (<i>jeevan</i>)	The only reality there is
How many selves?	As many as there are brains; none survive	Many <i>jeevan</i> units, forever distinct	Ultimately one Self, without a second
What survives death?	Nothing (the atoms scatter)	<i>Jeevan</i> , intact, as a unit	The question is misposed: <i>Atman</i> was never born
Method of knowing	Measurement, experiment, replication	Study + self-verification + evidence in conduct	Scripture, reasoning, meditation under a teacher
Goal of life	(Not science’s question)	Awakening: resolved, humane living in society	Liberation: recognising the Self as Brahman

4.1 The key contrasts in plain words

On the body. Science says the body is the whole human. Advaita says the body is finally unreal. Shri. Nagraj takes the middle: the body is real but is not the whole human — it is the *jeevan*’s vehicle. This

middle position is exactly why the philosophy is called *madhyasth* (middle). His counter-slogan to Vedanta keeps Brahman and saves the world:

“Brahma is truth, the world is perpetual.”

— MVD, *The Alternative*, point 8

On the self. Science: no self over and above brain processes. Advaita: one universal Self, with individuality as illusion. Shri. Nagraj: many individual selves, permanently individual — which is why relationships and values are fully real in his system and only provisionally real in Advaita.

On matter and mind. Science: mind comes *from* matter’s organisation. Advaita: matter comes *from* mind (consciousness). Shri. Nagraj: mind *is* matter at its highest development — an insentient atom that crossed a one-way threshold into sentience.

On method. Science trusts public instruments; Advaita trusts scripture and contemplative insight; Shri. Nagraj trusts study plus living conduct as evidence. Each side considers the others’ method insufficient: science finds both Indian methods unfalsifiable; both Indian views find science blind to the knower doing the science.

Where the alliances fall. Against the materialist, Shri. Nagraj and Advaita stand together: the human is not just the body. Against Advaita, Shri. Nagraj and the scientist stand together: the world is real and worth studying. Against both, the scientist insists nothing survives death. Each pair agrees on something the third denies.

Other anthropologies — Buddhist *anatta* (no permanent self), Abrahamic soul doctrines, and Dvaita-style eternal individual souls — offer further comparisons; see the wider table in [The Ontology of Coexistence](#) §5.

5. Critical Review

No view escapes serious objections. Here is where each is strong and where each is vulnerable.

5.1 Madhyasth Darshan — coherent inside, unproven outside

Strengths. It is internally consistent and ethically serious. It cleverly avoids two famous problems: unlike Advaita, it does not have to explain why an illusory world feels so real; unlike panpsychism, it never faces the “combination problem” (how billions of micro-minds combine into one), because the self is *one* complete atom, not a chorus of particles. Its **latency** account of sentience at *gathanpurnata* — actualizing ever-present intelligibility rather than assembling micro-minds — parallels threshold grammar in IIT and weak emergence while restricting active sentience to one constitutionally complete unit ([The Ontology of Coexistence](#) §6.2.10). And unlike most spiritual systems, it proposes a test: awakened conduct, observable by anyone.

Weaknesses.

- **The conclusion is built into the premises.** The foundational axiom already declares existence “not just physicochemical matter” — so the system is anti-materialist *by assumption*, not by

proof.

- **Different jobs do not prove two things.** The central argument — body serves food and sleep, *jeevan* serves values, therefore they are distinct entities — is a leap. One system can serve many purposes. And even granting distinctness, nothing in the phenomenological argument in §1.3 alone establishes that *jeevan* is *eternal*; that claim rests on the ontological argument in §1.2 and the conservation-based reading developed in [The Ontology of Coexistence](#).
- **Constitutional completeness is unexplained, not merely unmeasured.** No observation in particle physics or chemistry presently operationalizes *gathanpurnata*. The deeper tension — whether sentience at completeness is latent potential actualized or a form of emergence the system elsewhere resists — is analyzed in [The Ontology of Coexistence](#) §1.10 and §6.2. Until that is settled internally, “sentient atoms are not physics” remains a fair objection from the scientific leg.
- **The interaction problem is unanswered.** If an atom-sized *jeevan* steers neurons and muscles, that steering must either violate local energy conservation or produce a detectable causal anomaly in the brain’s physical budget. None has been found, and the literature gives no mechanism. See §2.2.3 above and [The Ontology of Coexistence](#) §6.2.5.
- **Immortal individuality meets *anatta*.** Buddhist and Madhyamaka traditions deny an enduring self through aggregate decomposition or dependent origination — a pressure distinct from Advaita’s witness but converging on post-death continuity ([The Ontology of Coexistence](#) §6.2.2).
- **It risks being unfalsifiable.** Disagreement is attributed to “lack of awakening,” so no observation can count against the system. A claim that cannot be wrong cannot be tested. A fair test would require, at minimum: operational criteria for constitutional completeness; reproducible markers distinguishing *jeevan*-mediated from brain-only activity; and independent evidence for post-death continuity ([Knowledge, Knower, and Known](#) §6.2).

Madhyasth Darshan is best read as an internally coherent, ethically rich *proposal*, not a demonstrated ontology.

5.2 Scientific materialism — powerful method, unfinished story

Strengths. Unmatched explanatory and predictive success. Medicine, neuroscience, and psychology genuinely explain much of what older systems attributed to souls. Its method — public evidence, falsifiable claims, replication — is the only one of the three that systematically catches its own errors.

Weaknesses.

- **The hard problem stands.** Correlating experience with brain activity is not explaining why there is experience at all. “Emergence” names the mystery; it does not solve it (§2.5). Madhyasth Darshan claims mystery is removable through study and aligned reflection; science treats the explanatory gap as philosophically non-decisive — neither side settles the other on method alone ([Knowledge, Knower, and Known](#) §3.4).

- **It explains the known, not the knower.** Science is performed by conscious subjects whose first-person reality is the one datum it cannot reach with third-person instruments. Dismissing that datum because instruments miss it may be circular in its own way.
- **Method is quietly promoted to metaphysics.** “Science detects only matter” is a fact about the method; “therefore only matter exists” is a philosophical leap. Many working scientists are methodological naturalists, not metaphysical materialists — the distinction is often blurred in debate.
- **It has little to say about meaning.** Values, purpose, and the question “how should we live?” are outside its scope. That is not a refutation, but it explains why purely materialist accounts of the human feel incomplete to many — the dissatisfaction Shri. Nagraj built his case on.

Scientific materialism offers the strongest method and the best-supported account of the body — but its claim to be the *complete* account of the human is a philosophical position, not a scientific finding.

5.3 Advaita Vedanta — profound, but at a steep price

Strengths. It takes the one undeniable datum — consciousness — as the starting point rather than an afterthought, which is philosophically defensible: experience is the only thing we know directly. It is supported by a sophisticated 1,200-year commentarial tradition, and its core insight (the observer cannot be any observed object) is a serious argument, not mere assertion.

Weaknesses.

- **The world-as-appearance claim is uncheckable.** Nothing within experience could ever confirm or refute that experience as a whole is *mithya*. Like Shri. Nagraj’s system, Advaita is unfalsifiable — but more radically, since it demotes the very arena in which evidence exists.
- **It must explain the appearance it denies.** If only Brahman is real, why does ignorance (*avidya*) exist, whose is it, and how does the One appear as many? Advaita’s sub-schools disagree among themselves on this — a sign the problem is real.
- **Ethics sits awkwardly.** If individuality and the world are provisional, the ultimate significance of relationships, justice, and suffering is also provisional. Advaita does teach ethics — but as preparation for liberation, not as the point. This is precisely Shri. Nagraj’s complaint: a philosophy that demotes the world struggles to ground responsibility *in* it.
- **The authority is scriptural.** The final warrant is the Upanishads as interpreted by the tradition. For anyone who does not grant scripture that status, the system’s deepest claims rest on testimony.

Advaita is the most radical and in one way the most rigorous answer — but its rigor is purchased by declaring unanswerable every question about the world we actually live in.

5.4 The bottom line

All three views are partly armoured against refutation: science by ruling first-person evidence out of bounds, Shri. Nagraj by attributing dissent to lack of awakening, Advaita by demoting the empirical

world entirely. The genuine disagreement is about **what counts as evidence** — instruments, conduct, or contemplative insight — and that is a philosophical choice no experiment settles.

What would actually move the debate: a measurable anomaly where neural dynamics deviate from physical prediction (which would support a real, interacting *jeevan*); a complete mechanistic account of valuation and felt experience (which would remove the work *jeevan* and *Atman* are posited to do); or a rigorous, pre-registered demonstration that the conduct-based test Shri. Nagraj proposes reliably distinguishes practitioners from controls. Public science would additionally require operational criteria for constitutional completeness, reproducible markers for *jeevan*-mediated versus brain-only activity, and independent evidence for post-death continuity of a sentient unit ([Knowledge, Knower, and Known](#) §6.2). Until something of that kind exists, the three answers remain what they are now: parallel accounts, each coherent from inside, each unproven from outside.

Appendix: Quick Glossary

Key terms from §§1–5 are collected here for quick reference. Each term is also defined where it first appears in the exposition.

Term	Plain meaning
<i>Jeevan</i>	The sentient self — in Shri. Nagraj’s view a real, eternal, atom-scale entity that works <i>through</i> the body. Not brain activity, and not “soul” in the usual religious sense. For ontology of <i>jeevan</i> , constitutional completeness, and conservation, see The Ontology of Coexistence .
Constitutional completeness (<i>gathanpurnata</i>)	The state when an atom integrates the required particles and crosses irreversibly into sentient status as <i>jeevan</i> . Developed in The Ontology of Coexistence §1.10.
Coexistence (<i>saha-astitva</i>)	Existence seen as all units inseparably present together.
Knowledge order (<i>gyan avastha</i>)	The human level of nature — able to know and evaluate every other level.
<i>Gyan udghatan</i>	The unfolding of knowledge in thought and conduct — an activity exclusive to awakened <i>jeevan</i> , not the brain or insentient matter (Knowledge, Knower, and Known §1.1).
<i>Pramanikta</i>	Authentic conduct as living proof that understanding has taken hold — the epistemic standard for complete knowing (Knowledge, Knower, and Known §1.6).
<i>Rahasyata</i>	Mysteriousness — removable deficit in the knower’s reflection, not a permanent opacity of nature (Knowledge, Knower, and Known §1.11).

Term	Plain meaning
Sensitivity / comprehension	Body-based responsiveness to pleasure, health, and gain versus <i>jeevan</i> ’s grasp of relationship, value, and order (Knowledge, Knower, and Known §1.9).
Six perspectives (drishti)	Built-in evaluative lenses in <i>jeevan</i> — lower <i>priya/hita/labh</i> and humane <i>nyaya/dharma/satya</i> (The Ontology of Coexistence §1.10.5).
Atman / *Brahman*	In Advaita Vedanta: the innermost Self / the one ultimate reality. Advaita says they are identical.
Mithya	Advaita’s term for the world: not absolutely real, a dependent appearance.
