

Existence-based human-centric contemplation

Natural / Madhyasth Darshan — Coexistentialism

Manav Karm Darshan

Madhyasth Darshan — Part 2

Postulate: The omnipresence of knowledge and the beginninglessness of nature

Principle: Effort – Motion – Result

Propounder and author: A. Nagraj

Working English translation (unpublished draft for study use)

Usage policy: This publication is for universal wellbeing (*sarvashubh*) and has no commercial purpose. Use and copying are available for private study. For any other use (copying, printing, etc.), prior written permission from Divyapath Sansthan, Amarkantak, is mandatory. When using these concepts elsewhere, a full citation of this text is expected. Please maintain the sanctity of the holistic view.

Alternative (*vikalp*)

1. The study of humans could not be completed through the unstable, uncertain, physicochemical-centric method of science, nor through mystery-based idealistic contemplation. Both these ideologies categorised humans as mere living beings (*jeeva*).

As an alternative, through the existence-based human-centric contemplation method of Madhyasth Darshan (Co-existentialism), the human being is identified and established in the knowledge order.

According to Madhyasth Darshan, the human being is the knower, and existence as coexistence is the object to be known (understandable and acceptable) — this is the knowledge of the holistic view (*darshan*). Along with this, the knowledge of *jeevan* and the knowledge of humane conduct, which validate coexistence, are now accessible for study.

I have presented this existence-based human-centric knowledge — Madhyasth Darshan and Co-existentialism — in the form of treatises (*shastra*) for study.

2. Prior to this existence-based human-centric contemplation, my initiation was in spiritual knowledge and Vedic tradition-based worship and action (*upasana-karma*).
3. According to the Vedanta view, “Brahma is truth, the world is an illusion (*maya*),” while also stating that the world of living beings originated from Brahma. In the language of tradition: *upasana* refers to the rituals and ceremonies for becoming deities (Vedic worship); *karma* refers to all actions aimed at attaining heaven; in *Manu Dharma Shastra*, daily duties (*nitya karma*) for the four classes (*varnas*) and four stages of life (*ashramas*); in ritual texts (*karmakanda*), sixteen kinds of rituals from conception (*garbha sanskar*) to death (*mrityu sanskar*). By studying all these, my mind presented a question -

4. If Brahma is “truth, knowledge, and infinite,” how can the world of living beings originated from Brahma be false? In the process of seeking answers to these questions from contemporary Vedic scholars and experts:

I was assured that the unknown becomes known in the state of *samadhi*. On the basis of scriptural support, I resolved to perform *sadhana*, *samadhi*, and *samyama*. In the states of *sadhana*, *samadhi*, and *samyama*, I attained complete understanding of the entire existence as coexistence through the method of study and realisation, as a result of which this Alternative (*vikalp*) emerged in the form of the treatises of Madhyasth Darshan (Co-existentialism).

5. According to idealistic scriptures and mystery-based God-centric thought and tradition, knowledge is unmanifest and inexpressible. In Madhyasth Darshan, knowledge is manifest and expressible, understandable through study, and verifiable through behaviour, making evidence easily accessible to all.
6. According to materialism, which is based on instability and uncertainty, science is considered to be knowledge, in which rules are treated as human-made. In its alternative, according to the existence-based human-centric contemplation of coexistence, existence is stable, development and awakening are definite, and all rules are natural.
7. Existence is not merely physicochemical; rather, physicochemical entities and *jeevan* entities are present as inseparable in the omnipresent reality. This is the core formula of the treatises of Madhyasth Darshan (Co-existentialism).
8. Where I began this bodily journey, my ancestors were renowned as Vedic scholars (*vedamurti*). In my home and village, the Vedas, and Vedic thought related to Vedanta, Upanishads, and Darshan, were continuously heard as language, sounds, and melodies. In my family tradition, Vedic-aligned worship (*upasana*), adoration (*aradhana*), prayer (*archana*), and libations (*tarpan*) were performed.

9. In our family tradition, high-caliber scholars were naturally service-oriented and industrious in their practice of behaviour and action. I accepted the industriousness and service-oriented tendencies, but question marks remained in my mind regarding their scholarship.

10. **First question:** If Brahma is truth, how can the world and living beings that originated from Brahma-truth be false?

Second question: How can Brahma alone be the cause of bondage (*bandhan*) and liberation (*moksha*)?

Third question: What is evidence (*pramana*) — is the word the evidence, or the bearer of the word? Is the authoritative statement (*apta-vakya*) the evidence, or its enunciator? Is the scripture the evidence, or its propounder?

Fourth question: In the context of independent India, a constitutional assembly was formed, yet the constitution accepts elected representatives without defining nation, nationality, and national character.

How can public mandate and representatives be genuine when they arise from vote–money alliances?

The constitution states secularism, yet explicitly mentions numerous castes, sects, and communities.

The constitution states equality, yet details reservations and their procedures.

In this democracy, the election of public representatives is governed by alliances of vote and money. What kind of democracy is this?

11. To find liberation from this web of questions, on the suggestion of contemporary scholars, Vedic experts (*vedamurti*), and honourable sages:

(1) I accepted *samadhi* as the sole path pointed out for making the unknown known.

(2) I accepted Amarkantak as a suitable place for *sadhana*.

(3) I began the practice of *sadhana* in 1950; maturity in *sadhana* came in the 1960s.

(4) In 1970, the state of *samadhi* was attained. In this state of *samadhi*, my expectations, thoughts, and desires remained silent. I realized that in this state, the occurrence of the unknown becoming known was zero. This state lasted twelve (12) to eighteen (18) hours daily.

Following the sequence of *samadhi*, *dhyana*, and *dharana*, I accepted the self-motivated system of *samyama*. After two years of *samyama*, the validation of *samadhi* was established. The process of accomplishing *samyama* from *samadhi* also took 12 to 18 hours daily. As a result, I realised the entire existence as coexistence, which was presented in the form of the treatises of Madhyasth Darshan (Co-existentialism).

12. **Coexistence:** The entire insentient and sentient nature is saturated and eternally present in the omnipresent reality.

Within coexistence:

(1) In the development progression of atoms, “hungry” (unsaturated) and “undigested” (unstable) atoms, and constitutionally complete, satisfied atoms that emerge through evolution, are understood to exist as *jeevan*.

(2) A constitutionally complete atom is understood to exist as a sentient unit — *jeevan*.

(3) From hungry and undigested atoms, molecules, and biological cells (*pranakośa*), all physical, chemical, and biological order structures form, and from these atoms and molecules, the earth and other planets are clearly understood to have formed.

13. In existence, on this earth (which is a physical structure), through chemical processes and composition, biological cells formed and flourished as vegetation. Following this, biological cells formed animal bodies, and finally, the human body and tradition were completed and understood.

14. **Within coexistence:** The human tradition is understood as the combined form of body and *jeevan*.

In, from, and for coexistence, coexistence was understood to be eternally effective; this itself was understood as the natural progression (*niyatikram*).

15. **Natural-law: Only by the natural method of coexistence:**

(i) Four orders in existence: material order, biological order, animal order, knowledge order; and

(ii) Four planes in existence: biological plane, delusion plane, deific plane, divine plane; and

(iii) Development progression and development; awakening progression and awakening.

And the eternal glory of the awakening-based human tradition, replete with human-ness, orderliness, and participation in the overall orderliness, was understood. I accepted this as the universal-auspicious formula and recognized the aspiration for universal welfare in all humans. As a result, I have presented before humankind the natural explanation of consciousness-development value education, constitution, conduct, and orderliness.

May the earth be heaven, may humans be divine,
May dharma succeed, may there be eternal auspiciousness.
— A. Nagraj

Fundamental concepts of Madhyasth Darshan

1. The Proclamation

Let live and live.

2. The Wish for Universal wellbeing

May the Earth be heaven, May humans be deities, May dharma prevail, May goodness be eternal.

3. The Realisation Knowledge

Sentient and insentient nature saturated in Omnipotence. The countless sentient and insentient units are saturated in Omnipotence (Omnipresence). All units saturated in the Omnipresence (permeative and transparent) have form, properties, essential nature and dharma, and have inherent orderliness and participate in overall orderliness.

4. The Principle

Effort – Motion – Result

5. The Sermon

Believe what is known Know what is believed

6. The State of Existence

The state-dynamic nature saturated in the state-complete Omnipotence Eternally present Coexistence

7. The Evidence

Realisation – Behaviour – Application

Realisation itself is the ultimate evidence; evidence itself is the understanding or knowledge; understanding itself is manifest; the manifest itself is resolution, work and behaviour; work and behaviour itself is evidence; evidence itself is awakened tradition; awakened tradition itself is coexistence.

8. Reality

Brahma is truth, the world is perpetual. - Brahma (Omnipotence) is omnipresent, and jeevan-clouds are many. - Atma, buddhi, chitta, vritti and mun are indivisible in a jeevan-cloud. - The grandeur of humans as a joint form of jeevan and body. - God is omnipresent, deities are many. - Human kind is one, vocations are many. - Earth is one (undivided nation), States are many. - Human dharma is one, resolutions are many. - Jeevan is immortal; birth and death are occurrences.

9. Actuality

Development Progression, Development in Coexistence. - Awakening Progression, Awakening. - Expressions of Awakening — Wise Human Tradition.

10. The Knowledge

- Knowledge of jeevan in coexistence.
- Knowledge of the holistic view of existence in the form of coexistence.
- Knowledge of humane conduct.
- Realisation itself is knowledge.

11. The Finding from Exploration

- Constitutional completeness
- Activity completeness
- Conduct completeness

12. The Basis

Nature saturated in Omnipotence (coexistence).

13. The Postulations

The physicochemical nature itself is in development progression. Atom in the developed form itself is the sentient unit. - The sentient unit i.e. jeevan itself evidences undivided society in human tradition upon awakening. - Alertful humaneness, deific humaneness and sociality. - Divine humaneness with complete awareness. - Constitutional completeness, Activity completeness, and Conduct completeness.

14. Truthfulness

Nature saturated in the Omnipotence itself is the universe. - Nature itself is destiny. - Destiny itself is orderliness. - Orderliness itself is development and awakening. - Development and awakening itself is the universe. - Rule itself is justice, justice itself is dharma, dharma itself is truth, truth itself is glory (coexistence), experiencing glory itself is bliss, bliss itself is jeevan, and jeevan has rule within it. - The deluded human alone is free while doing karma and dependent while experiencing result. - The awakened human is free both while doing karma and while experiencing result.

15. The Refuge of Humans

Undivided society, universal orderliness (coexistence) — the tradition of spontaneous evidence.

16. The Humane Orderliness

Humaneness. Orderliness with human-ness, participation in the overall orderliness.

17. Completeness in an Individual

- Activity completeness
- Conduct completeness

18. Completeness in Society

- Comprehensive resolution
- Prosperity
- Fearlessness
- The tradition of evidence of coexistence

19. Completeness in Nation

- Skill
- Proficiency
- Scholarliness

20. Completeness in the World (Undivided Nation)

Oneness in humane culture, civilisation, law, and orderliness (universality).

21. Dharma of Humans

Happiness, Peace, Contentment, and Bliss

22. The Basis of Moral Policy

Orderliness for the right-use of wealth in the form of body, mind, and money.

23. The Basis of State Policy

Orderliness for the protection of wealth in the form of body, mind, and money.

24. The Path to Realisation, and Contemplation

- Gross to subtle
- Subtle to cause
- Cause to great-cause

25. The Evidence of Awakening

- From inhumaneness to humaneness
- From humaneness to deific humaneness
- From deific humaneness to divine humaneness

26. Auspiciousness

Jeevan is auspicious. - Emergence is auspicious. - Resolution is auspicious. - Realisation is auspicious. - Awakening is auspicious.

27. Universal Auspiciousness

Non-discrepancy (harmony) and unanimity in all four dimensions of the human being (work, behaviour, thought, and realisation), all five levels (individual, family, society, nation, and international), and the ten-stage family-based self-governance orderliness.

28. The Greatest Auspiciousness

Awakening as realisation in truth (liberation from delusion).

29. The Accomplishment

- The realisation in the established values in coexistence
- Evidence of resolution, prosperity, fearlessness and coexistence — this itself is universal wellbeing.
- Liberation from delusion and eternal awakening.

30. Completeness in Education

- Consciousness-development value education
- Craftsmanship (technical) education

31. Wholeness in Tradition

- Humane education *sanskar*
- Humane Constitution
- Humane family-based self-governance orderliness

Main points propounded in Madhyasth Darshan

Omnipotence is mediating and omnipresent. Nature in Omnipotence is generative-degenerative and mediating activity, and is limited; therefore Omnipotence is state-complete.

Insentient and sentient nature in Omnipotence is state-dynamic; therefore nature is immersed in Omnipotence — nature is interwoven with Omnipotence. Because nature is saturated in Omnipotence, nature is fully energised; therefore nature is active. Hence nature is effort-, motion-, and result-bearing. As a result, nature itself is manifest in four orders. Therefore, in insentient-sentient nature saturated in Omnipotence, the sentient part affords appropriate opportunities for the capacities of experiencing in the knowledge order, and all four orders are bound to one another in the sense of completeness and wholeness.

Omnipotence is mediating; therefore nature saturated in mediating Omnipotence is controlled and protected. The nucleus (*madhyansh*) found in every atom is mediating activity; therefore generative-degenerative activities and relative forces are controlled and protected.

Infinite activity, or groups of activity, is nature — countable as insentient and sentient. Insentient nature, after completeness of development, attains the sentient stage by the natural-law method. The human being is the combined form of insentient and sentient, and is also a part of nature.

Constitutional completeness in the development progression is, in the awakening progression, activity completeness and conduct completeness in the deluded human. The awakened human, together with less-developed nature, provides nourishment to right-use and usefulness in vocation and behaviour. Behaviour with the human being is a duty to honour those more awakened, and to practise, study, and contemplate for greater awakening.

The deluded human alone is free while doing karma and dependent while experiencing result.

On this earth the human being is in the awakening progression; he has the opportunity, desire, and possibility of becoming awakened. The chief characteristic of the awakened human is to be helpful to the less developed.

From the material order the biological order develops; from the biological order the animal order develops; and from the animal order the animalistic human of the deluded knowledge order develops. From the animalistic human develops the deluded demonic human; from him the humane human; from him the delusion-free deific human; and from the deific human, development and awakening are complete in the divine human.

Every unit in the knowledge order has the capacity for a holistic view of insentient and sentient nature situated in Omnipresence.

Realisation knowledge and the holistic view are complete only in the state free from delusion. Therefore —

Freedom from delusion itself is awakening; awakening itself is full awareness; full awareness itself is sovereignty; sovereignty itself is supreme order; supreme order itself is undivided society and universal orderliness.

“The human being alone is primarily helpful in the decline and development of the human being.”

Jñānātmanorvijayate

Gratitude

I am grateful to all those who have shown the right path and kept the sources of reality alive to this day. Gratitude is a fundamental value in the progress toward awakening. At its root, gratitude is the foundational and protective value of culture and civilisation.

Those who lack gratitude cannot demonstrate that they are bearers of human culture and civilisation. Those who do not carry human culture and civilisation cannot uphold law and orderliness.

Culture, civilisation, law, and orderliness are mutually complementary. Without them, undivided society and sociality cannot be established. Thus, without gratitude there is no glory; without glory, no simplicity; without simplicity, no coexistence; and without coexistence, no continuity of gratitude.

The conduct of a person who embodies gratitude is instructive and inspiring for future generations. Such conduct finds fulfilment only in humaneness. I am grateful to everyone who, in whatever way, has readily supported consciousness-development value education.

Jñānātmanorvijayate

— A. Nagraj

Foreword (*prāk-kathan*)

Karm Darshan expresses the realisation of existence as coexistence, together with the glory and dignity of that realisation. Within existence is coexistence; within coexistence is development progression; and within development progression, development itself is the event of jeevan. This is an actual state of affairs. Jeevan awakening is the expression, communication, and manifestation of the capacity, ability, and worthiness for realisation. In this sequence, the human being is realised as indivisibly present in existence. The possibility of jeevan awakening being expressed in the human being, an indivisible constituent of existence, remains ever valid. Every human being equally possesses the capacity for realisation: it exists in every human being, proceeds from every human being, and is for every human being. On this truth, the expression of realisation is universally affirmed. Thus, in giving expression to *Karm Darshan*, I experience authenticity. Authenticity is itself bliss and the spontaneous expression of realisation.

This becomes resolution in communication and justice in behaviour, together with their continuity. Realisation signifies awakening in jeevan. Every activity, whether insentient or sentient, exists as strength in state and power in motion, because motion cannot be established without state. On the basis of this truth, realisation is bliss in state; its expression is authenticity, which, in motion, becomes evidence and resolution.

Thus, through study, the expression of awakening of jeevan, as the strength in realisation, has become readily accessible. I experience profound happiness in offering it to humankind.

— A. Nagraj

Chapter One

Karma

Every human being performs karma in nine ways: physically, vocally, and mentally, with each action being done, caused, or intended. Every karma bears a result.

Physical, vocal, and mental karma are evident in human beings across the past, present, and future. Combined with the distinctions of done, caused, and intended action, they form nine kinds. The human field of action encompasses only the natural, the social, and the intellectual, and its desired end (*abhīṣṭa*) is happiness—neither more nor less. Without happiness as its desired end, the human being finds no restfulness from effort. Karma is therefore activity animated by aspiration; complete activity is motion informed by awareness.

Pain (*vedanā*) is the pressure that arises from accepting what is unacceptable. The environment exerts this pressure; it is relative and directly evident. Relativity influences both decline and development.

Every karma has five components: the doer, cause, objective, result, and effect. Contact and relationship arise only for the fulfilment of necessity. Necessity itself is desire. At its root lie society and sociality, together with observance, adherence, conduct, following and cultivation.

Every activity undertaken from a holistic view to determine needs and commit to fulfilling them takes the form of desire. Desire expresses the awareness present in conscious activity.

Human beings expect the fulfilment of every desire and necessity to bring happiness.

Every act is undertaken in the hope of happiness. Through the realisation-based method, the forms of happiness—happiness, peace, contentment, and joy—become naturally knowable. Desire can be fulfilled only when desire, action, and result are in balance. Human aspiration seeks intellectual, collective, and natural advancement through rules and processes that provide a definite direction.

Human action has proved capable of either sustaining or undermining the happiness people have long sought. It is understood in three parts: righteous action, unrighteous action, and mixed action. Righteous action is directed toward union and awakening; unrighteous action takes the form of offence and reaction; and mixed action takes the form of enjoyment and retaliation. Every karma, without exception, is relative to its result.

The results of karma are understood in four forms: moksha, dharma, *kama* (desire), and wealth (*artha*). There is no karma without desire. Human desires are distinguished as intense, causal, and subtle. Intense desires readily lead to action; causal desires are less likely to do so, and subtle desires less likely still.

Intense desires are those without which one cannot live.

Causal desires are impulses arising from union, coincidence, or happenstance.

Subtle desires concern truth, dharma, justice, or some object for which no clear thought yet exists that could provide evidence.

Means are distinguished as internal and external. Internal means comprise hope, thought, desire, resoluteness (*īrtambharā*), and the evidence of realisation; external means comprise body and wealth. Together they reveal the respective roles of insentient and sentient activity. The accomplishment of desire lies in attaining oneness, balance, and harmony between the insentient and the sentient. Every human being plainly strives toward this fulfilment.

Attaining the aim (*sadhya*)—the desired end (*abhiśā*)—requires the seeker's dedication and the deployment of means. The means are resources (*artha*), evident as body, mind, and wealth. These resources are produced through work and, in turn, serve as the means through which karma is formed.

Every karma carries a sequence of experiencing and inference. This sequence continues until realisation. Experiencing Truth (*satyanubhūti*) alone is completeness. Relative truth, objective truth and absolute truth are naturally known through realisation. Realisation is therefore the full meaning of all meaning (*artha*).

All karma serves the acquisition of wealth, and the purpose of that acquisition is realisation. The acquisition, use, right-use, and distribution of wealth likewise serve the fulfilment of desire. Realisation is the basis of this fulfilment. With awakening, it becomes evident in both the individual and humanity as a whole. The holistic view and knowledge concern what exists; this holistic view and knowledge constitute realisation.

For human beings, happiness is the desired state of equilibrium (*abhīṣṭa*). Directing internal and external means toward realisation is full awareness; directing them otherwise is the absence of full awareness. The possibility of either condition accounts for human diversity.

External means are controlled according to the capacity of the internal means—hope, thought, desire, resoluteness, and the evidence of realisation. The totality of the internal means constitutes the conscious. Insentient and sentient nature is contained within knowledge (Omnipotence) and is therefore governed by it. Through such balance and regulation, development and awakening proceed toward realisation.

In jeevan endowed with knowledge, freedom from delusion arises; in the opposite condition, delusion is evident. Knowledge comprises realisation, resolve, desire, thought, and hope. Their full expression depends on the conscious unit's orientation toward awakening and its capacity.

The capacity endowed with freedom from delusion fulfils the desired end, because it enables proper and refined karma. Knowledge expressed through the human being takes three forms: (1) physical, (2) intellectual, and (3) spiritual (coexistence). It is manifested as skill, proficiency, and scholarliness.

Material science principally employs the external means, whereas intellectual and spiritual science employ the internal means. Material science and psychology deal in relative knowledge and study, whereas the Spirit (Omnipotence) is absolute and determinate knowledge. Relativity encompasses gain, expenditure, decline, development, and awakening. The right-use of the powers of words produces knowledge, while wasting them produces ignorance. A person becomes deprived of whatever they waste.

Karma yields wealth or calamity, good desire or unrighteous action, dharma or un-dharma, and moksha or bondage. Within the programme of jeevan, wealth, good desire, dharma, and awakening directed toward moksha constitute happiness. Their opposites give rise to the processes and problems of sorrow and pain.

Dharma is all-round resolution. Resources (*artha*) comprise body, mind, and wealth; the supreme meaning is realisation. In an awakened human being, good desire means that cognisance governs and validates sensation. Moksha is freedom from delusion.

“Wealth alone is happiness, righteous action alone is peace, dharma alone is contentment, and moksha alone is supreme joy.”

Desire takes seven graded forms:

Wealth in the service of moksha is the highest of the high, while moksha in the service of wealth is the lowest of the low. Wealth in the service of dharma is intermediate-to-high, while dharma in the service of wealth is low. Wealth in the service of *kama* is high, *kama* in the service of wealth is low-to-intermediate, and wealth sought for its own sake is intermediate.

Differences in desire lead to different forms of exploration; these lead in turn to destination, realisation, value, sociality, and universal orderliness.

The human being has three kinds of exploratory tendency:

(1) truth-oriented exploration, (2) motive-oriented exploration, (3) instincts-oriented exploration.

Instincts-oriented exploratory tendencies also occur in animals; the other two belong to the human being alone. Because of this, instincts-oriented exploration remains liable to wrongdoing.

Non-attachment to objects is dispassion, or freedom from vitiations. Non-attachment to motives is supreme-detachment, or the acceptance and observance of right-use.

Instincts-oriented exploration serves self-interest; motive-oriented exploration serves the interests of others; and truth-oriented exploration serves the ultimate good.

Behaviour governed by self-interest is base and antisocial; behaviour directed toward others' interests is social and intermediate-to-high; and behaviour directed toward the ultimate good is the highest, social, and free. The last expresses the mentality of universal wellbeing.

Tendencies may be goal-based, value-based, or interest-based.

Human activity arising from righteous or unrighteous action is shaped by unions rooted in intellect and inclination.

Kāsā, *ākūti*, and *medhā* are forms of intellect arising from union; *mati*, *sumati*, and *anumati* arise from righteous action; and *amati*, *kumati*, and *durmati* are tendencies arising from unrighteous action.

Kāsā, born of union, is expressed in poets, learned people, and artists. *Ākṛti* (the source's spelling here) appears in the divine worker who brings about comprehensive resolution; purposeful divine application appears in the undeluded divine knower; and *medhā*, joined with complete knowledge, appears as moksha, or freedom from delusion. These become evident as kindness, grace, and compassion.

Mati, born of righteous action, is expressed in socially accepted action, conduct, work, and behaviour. *Sumati* is expressed in action necessary for society, in conduct, work and behaviour. *Anumati* is expressed in exemplary action worthy of emulation, in conduct, work and behaviour.

Righteous action comprises right intellect, right tendency, right understanding, right science, sociality, and true resolve.

Amati, born of unrighteous action, is expressed in socially unacceptable action, conduct, work and behaviour. *Kumati* appears in vile action—specifically prohibited action—and in conduct, work and behaviour. *Durmati* appears in wicked action, conduct, work and behaviour, such as coveting another's wealth or spouse or inflicting pain on others.

Through endeavour and practice, instincts-oriented tendency remains absorbed in unrighteous action, motive-oriented intellect in righteous action, and truth-oriented intellect in union—that is, awakening.

The way each person is naturally inclined to act reflects the combined influence of environment, study, and *sanskar*.

The environment is distinguished as natural or human-made.

Education and orderliness constitute the human-made environment.

Human *sanskar* is expressed through the “exploration-trio”: instincts-oriented, motive-oriented, and truth-oriented exploration.

The natural environment of a region is assessed in terms of its balance of cold, heat, and rainfall, together with the three non-human orders.

The natural environment of any land depends on its quantities of minerals and vegetation, which in turn depend on that land’s development.

Before human beings of the knowledge order can inhabit any land, animals and plants must be abundant; before that, water must be present.

Animals and human beings can sustain their life cycles and jeevan programmes only within definite lower and upper limits of cold, heat, and rainfall.

The balance of the natural environment also supports the human being’s natural awakening. Therefore:

A basis is necessary for balance.

Omnipotence (*sattā*), which is complete, is the basis of balance for the whole of nature, without exception.

Complete rules are the basis of balance in every activity.

Complete justice is the basis of balance in every behaviour.

Complete resolution is the basis of balance in every thought.

The supreme truth of coexistence, which is whole, is the basis of realisation in every person.

The human being is the principal cause of natural and human balance and imbalance. A deluded person is free when acting but dependent when experiencing the results. An awakened person remains free both in action and while experiencing its results. Awakened tradition acts after understanding; deluded tradition seeks to understand after acting. Human beings are the primary users of natural splendour.

To maintain seasonal balance, human beings must use minerals and vegetation (forests) while preserving as much of them in the land as is necessary. They must also support their production process without obstructing it. This is the meaning of natural law and is entirely the human being's responsibility.

Forest and mineral resources should be used in proportion to the known possibility and progression of their production. Otherwise, suffering from natural calamities naturally follows.

Education and orderliness are the sole means of maintaining collective (social) balance.

Social balance rests on a tradition of work and behaviour grounded in righteous wealth, marital faithfulness, and kindness. The opposite—pursuing another's spouse or wealth and causing pain to others—creates imbalance.

Intellectual balance depends on the activity of a person's necessary and unnecessary fundamental tendencies. *Sanskar* and understanding underlie the necessary tendencies; delusion and compulsion underlie the unnecessary ones.

The necessary fundamental tendencies manifest, in sequence, as non-accumulation (prosperity), affection, learning, simplicity, and fearlessness (trust in the present); the unnecessary tendencies manifest as convenience, accumulation, malice, ignorance, conceit, and fear.

The rules suited to natural, social, and intellectual balance are the necessary rules. Together, they form the "rule-trio."

Knowledge and observance of the necessary rules are determined by their right-use; right-use by development and awakening; and development and awakening by understanding and observing intellectual, social, and natural rules. Human beings must follow the necessary rules to keep the progression of development and awakening unbroken. This is the practical programme of human jeevan, the awakening progression, and awakened jeevan.

Immersion in, observance of, and evaluation of cultural values constitute the human-made environment.

A person's *sanskar* expresses their essential nature. Wholesome *sanskar* gives rise to human culture and progressively refines it toward completeness.

Complete *sanskar* is expressed as a humane or higher-humane essential nature.

A refined culture manifests as humane essential nature.

A distorted culture manifests as inhumaneness.

A culture imbued with sociality becomes evident through humaneness. Culture, civilisation, method, and orderliness exist to nourish such humaneness.

They are mutually complementary: civilisation provides nourishment to culture, method to civilisation, orderliness to method, and culture to orderliness.

In awakened tradition, the humane cultural programme gives expression to *sanskar*, for no human being in such a tradition is devoid of it. Deluded human traditions, by contrast, are reckoned as communities. This is the cause of the entire problem. Problems are not evidence of *sanskar*, since all problems are resolved.

Visualisation and thought reveal, respectively, art and usefulness.

Thought grounded in wholesome *sanskar* is awakening.

Humane *sanskar* indicates universal culture. Tendencies below this—that is, inhumane tendencies—cannot become universal.

Healthy, universal culture and civilisation arise only through the observance of social rules, thereby establishing the wholeness and continuity of society.

Human beings are not satisfied by their own happiness and convenience alone; they are satisfied through behaviour and orderliness grounded in understanding. Each person therefore seeks to safeguard and make right-use of the conveniences they acquire. This is necessary. The human being is thus either already a social and justice-oriented unit or is compelled to become one.

Sociality combines intellectuality and physicality.

Physical activity is governed by intellectual capacity, since neither production nor behaviour is possible without thought.

People living in animal consciousness apply the perspectives of pleasant and unpleasant, beneficial and harmful, and profitable and unprofitable to physical vocation and its use. In awakened human tradition, the perspectives of just and unjust, dharma and un-dharma, and true and untrue prove decisive in behaviour and conduct.

People living in animal consciousness generate many problems; living in human consciousness, they evidence resolution.

Without studying good scripture, there is neither aspiration for truth nor a tendency toward it. Without aspiration for truth, there is no love of truth; without love of truth, no dedication to truth. Without dedication to truth, there is no establishment in truth; without establishment in truth, no awareness of truth. Without awareness of truth, there is no realisation of truth; without realisation of truth, no unveiling of good scripture. Without this unveiling, the study of good scripture is neither complete nor meaningful.

Dedication to humane conduct and just behaviour is found only in awareness of truth and experiencing.

Without humane conduct and just behaviour, mutually just exchange and benefit are impossible.

Just exchange and benefit constitute prosperity.

Unjust gain and advantage manifest as sorrow and problems.

A life grounded in realisation-based enlightenment is expressed as humaneness and higher-humaneness.

Without righteous expenditure, there can be no love of truth, right tendency, righteous action, happiness, peace, contentment, or joy.

Human beings are oriented toward true knowledge, study that enables them to behold truthfulness, and karma and conduct, because such a lawful life is both possible and necessary.

Within humaneness, every programme takes the form of method and orderliness. Putting it into practice is civilisation; sustaining that tradition is culture.

Sorrow, disquiet, and discontent both constitute conflict within the human being and arise from it.

All a human being's circumstances arise solely from their karma, upasana, and capacity for knowledge. These circumstances take the form of a suitable or unsuitable environment.

The conduct and behaviour of the awakened human being constitute orderliness, which is the cause of peace.

Responsibility extends as far as a human being's contacts.

Relationship entails the observance of responsibility.

In relationships, duty is governed chiefly by responsibility; in contacts, responsibility is governed chiefly by duty. This is sociality.

An auspicious environment is created through lawful processes of orderliness and an understanding of the causes of universally acceptable peace, resolution, and prosperity. In such conditions, the study and practice of good scripture become accessible to everyone.

The evident form of undivided society consists of scripture and thought capable of establishing undivided sociality; social programmes that are communicated; refined methods and orderliness; law-governed orderliness; individuals who embody conduct; and families capable of encouraging them. This is humanity's abiding aspiration and evidence—its longing and its possibility.

Human beings need peace and stability in every condition of jeevan. Individuals and families attain them through the study, ratiocination, and conduct of good scripture.

Only scripture and an education system capable of providing freedom from delusion about the whole, clarifying the direction and progression of awakening, determining human values universally, and providing appropriate education for the movement from humaneness to higher humaneness

can establish a life of peace and stability at every level. Without them, stability and peace in human life are not possible.

Human beings seek to direct all their actions toward happiness, peace, contentment, and their stability—goals together with the means to attain them.

Because human beings are free when acting, they experience happiness or unhappiness through the results of their actions. This is evident. Every action undertaken humanely in the intellectual, social, and natural spheres produces happiness; the same action undertaken inhumanely produces sorrow. This too is evident.

At present, human beings are reckoned in four categories:

(1) the meritorious soul, (2) the sinful soul, (3) the happy, (4) the unhappy.

At each of the five levels of human organisation—individual, family, society, nation, and international order—the policies and norms for relating to these four categories have their own distinctive character. In the same order, the individual's responses are reverence, neutrality, contentment, and kindness; the family's are glory, disregard, collaboration, and service; society's are award, refinement, cooperation, and collaborative sentiment; the nation's are respect, punishment (reform), guidance toward resolution, and cooperative sentiment; and the international order's are protection, deliverance, promotion, and a sentiment of refinement. Only a life endowed with these norms and policies, procedures, laws and regulations, behaviour, and conduct succeeds; otherwise it fails. The relationships are shown below:

	Meritorious soul	Sinful soul	Happy	Unhappy
Individual	Reverence	Neutrality	Contentment	Kindness
Family	Glory	Disregard	Collaboration	Service

	Meritorious soul	Sinful soul	Happy	Unhappy
Society	Award	Refinement	Cooperation	Collaborative sentiment
Nation	Respect	Punishment (reform)	Assurance	Cooperative sentiment
International	Protection	Deliverance	Promotion	Sentiment of refinement

No human value or programme can be realised without society and sociality.

Every human being acts within some programme.

That programme is karma.

Karma alone supports either decline or development and awakening.

Every unit in insentient and sentient nature moves toward either decline or development.

Knowledge, wisdom, and science together provide the sole basis for complete awakening. One engages in refined karma precisely to become endowed with this capacity. This must extend through the five levels and four dimensions of human life.

An international order without a holistic view of reality, a programme without resolution, an orderliness without reserves, a society fallen from dharma and lacking certainty, a family without righteous character, and an individual without good conduct all remain perpetually anxious.

Sociality is the evident form of dharma; it is culture and civilisation.

Sanskar, culture, and civilisation are necessary to sustain non-disparity in the natural mutuality among human beings; herein lies their usefulness.

Intense distress afflicts an international order that cannot uphold a holistic view of the whole free from mystery, a national order that cannot protect and promote truthfulness, a society that cannot propagate it, a family that cannot follow it, and an individual who cannot conduct themselves truthfully.

All harmful tendencies take effect when the needs one adopts exceed available opportunity (possibility). They principally take the form of exploitation, harming both oneself and others.

The means—body, mind, and wealth—constitute opportunity.

It is natural for means to be insufficient when needs are unrestrained and abundant when needs are restrained. Unrestrained needs entail waste.

Humaneness alone provides the guiding principle of restraint.

Form, strength, intellect, status, wealth, karma, upasana, necessity, occasion, and opportunity all have their proper place in the human being.

Assurances never put into practice, rights exceeding ability, scripture without principle, method without basis, and conduct without direction are all causes of distress.

Methods rest on three bases: (1) truth, (2) karma, and (3) objects.

When laws and regulations are grounded in scripture capable of clarifying truth as their basis, human beings attain happiness, peace, contentment, and joy—the thread of glory natural to humaneness and higher humaneness.

Law, regulation, and policy grounded in truthfulness unite the international order. They bind states and nations in continuous coexistence and make possible a human life free from individualism, communalism, and factionalism.

In a system governed by laws and regulations grounded in karma, exchange is free from gain and loss for oneself or others. It is not, however, free from class-sentiment.

In a system of governance whose laws and regulations are based on objects, there is gain and loss for oneself or others. It offers no account of society; the community is its limit.

Every action guided by wise reflection and the desire for upasana is beneficial at every level.

The capacity for the holistic view rests on awakening, which rests on aspiration and conduct. Aspiration and conduct rest on education and study; education and study on orderliness; and orderliness, in turn, on the capacity for the holistic view and understanding.

It is well known that knowledge becomes clear only when endeavour is aligned with knowledge, work with endeavour, result with work, realisation with result, and knowledge with realisation.

Human action, from beginning to end, seeks one of three kinds of result.

Every action serves self-interest, the interests of others, or the ultimate good.

Mediating intellect is inclined toward union; generative intellect is inclined toward righteous action. Within humaneness, the whole diversity of karma becomes free from contradiction. Conduct according to the “rule-trio” is the direct evidence of this.

In every union and separation, values are recognised and deployed.

Conjunction gives rise to sentiment, sentiment to activity, and activity to conjunction. This is the cycle of relativity and behaviour.

The capacity to determine and uphold social values distinguishes people with full sociality from those marked by asociality. This indicates human decline or development.

Mutual relations give rise to higher and lower forms of sentiment-based activity, through which the level of development becomes known.

Families guided by higher sentiments, a society based on generative–mediating union, and a system of orderliness and behaviour based on mediating–generative union constitute the programme of universal wellbeing.

Righteous action cannot be determined without a clear capacity for the holistic view. This capacity determines generative, degenerative, and mediating activity, process, and purpose. It also establishes completeness in conduct, behaviour, orderliness, and the education system.

Behaviour requires knowledge, wisdom, and science. Production requires wisdom aligned with knowledge, and knowledge informed by science aligned with wisdom. Such knowledge is manifested and applied according to each awakened individual's capacity and needs.

Practical values are determined through analysis. Such analysis accords with the immortality of jeevan, the mortality of the body, and the rules of behaviour.

Practical values are meaningful in humaneness. On this basis, the rule-trio—intellectual, social, and natural—is established.

Conduct and fulfilment within human mutuality are meaningful through the coexistential method; through the non-coexistential method, they are meaningless and problematic.

Humane conduct is the direct expression of the capacity for true knowledge.

The capacity to understand is the natural unveiling of knowledge within mutuality.

The capacity to understand is impressionability (*vyanjaniyata*). A unit's fundamental impressionability lies in its saturation in Omnipotence; experiencing this saturation is complete impressionability. Qualitative refinement of the conscious unit's capacity for impression is *sanskar*. This is the capacity for the holistic view and for

realisation. The holistic view of measure and boundary, and realisation in truth, are well known. The progression of impressionability makes both the awakening progression and awakening evident.

The human being is manifest within coexistence as both beholder and beheld; this is the ground of the holistic view.

A beholder must be present for a manifestation to be evidenced. The beholder is established through the capacity for impression.

Nature is the collection of infinite units—the totality of what is beheld.

Every beholder is also beheld by another beholder. Every unit is a beholder in accordance with its awakening.

The programme and conduct of human jeevan, from beginning to end, are of three kinds: (1) truth-conduct, (2) popular-conduct, and (3) object-conduct. These are reckoned, respectively, as best, middling, and worst.

Humane conduct is the natural evidence of conception. Conception becomes evident in disencumbrance (*nivṛtti*). Disencumbrance is impetus and wisdom; impetus and wisdom are accordance and adherence; accordance and adherence are unveiling; unveiling is manifestation; manifestation is the evident; the evident is evidence; evidence is experiencing; experiencing is capacity, ability, and receptivity; these are state-fullness; state-fullness is sustainment; sustainment is grandeur; and grandeur is conduct.

Seer-status corresponds to the capacity for the holistic view, and behaviour accords with it. Without thought, no work or behaviour is accomplished or evidenced through the body. Thought therefore lies at the root of all activity carried out through the body. The body is not thought; it is the medium through which thought is propagated. Thought is thus distinct from the body and is a conscious activity.

Ideational capacity is present in all five human states.

Therefore, all human beings are equal in capacity.

The true path and the auspicious study of yoga are established means of refining ideational capacity. Consciousness-development-value education brings a qualitative transformation in *sanskar*; this serves universal wellbeing. This, in turn, is ideational capacity. This progression forms a complete orderliness extending to humane and higher-humane conduct. It succeeds through the observance, adherence, and cultivation of the rule-trio; otherwise it fails.

The study of yoga is the study of meeting. After such meeting, acceptance appears as jeevan-awakening, while distortion appears as inhumaneness.

Every human being strives for full awareness. Humane conduct is its direct expression. Humaneness and higher humaneness constitute complete grandeur through orderliness.

The programme of jeevan is karma, and this itself is conduct.

In a humane person, conduct is directed toward prosperity, art, and enlightenment.

Conduct directed toward enlightenment of truth and naturalness is evident in humane and divine-humane human beings; this is their essential nature.

Only humane and higher-humane conduct is truly useful and necessary for human beings.

The five human states complement one another. Their unifying thread is undivided sociality. This arises from universal observance of the rule-trio.

Every discovery and exploration begins as an individual unveiling and becomes accessible to all through education and propagation. This is the process of universal generalisation.

A discovery concerns that which has sustainment and grandeur but was not previously known clearly to humankind. In comparison with the understanding present in human communities before the year 2000, Madhyasth Darshan is a discovery and an exploration.

Discovery is manifestation in, from, and for coexistence. Education is the process of generalising a discovery; this is consciousness-development-value education.

Human beings have as much opportunity for decline as for advancement. Decline-oriented activity is offence or error. Its direct manifestations are sorrow, disquiet, discontent, and the delusion of non-coexistence.

In a life oriented toward decline, wrongdoing has three causes: (1) deficiency, (2) excessive expectation, and (3) ignorance. Attachment, malice, untruth, conceit, fear, indolence, disease, and failure accompany them. There is a provision for resolving and removing these: deficiency through production and practice; excessive expectation through wisdom; ignorance through knowledge; attachment through dispassion; malice through affection; untruth through truth; conceit through simplicity; fear through fearlessness; indolence through initiative; failure through valour and renewed application; and disease through medicine, diet, and regimen. This is an occasion for human beings and is itself a necessity.

Using scientific capacity without waste prevents wealth from becoming a source of calamity.

Applying wisdom establishes an undivided society; this is heavenliness.

Science—proficiency and skill—is the capacity to quantify and regulate what is less developed than the human being. It is fully useful in production and partly useful in behaviour. Wisdom clarifies social values through analysis of the human self.

In coexistence, knowledge is what is seen, the human being is the seer, and the perspective is based on humaneness. Knowledge, behaviour, and resolution are thus evidenced in coexistence; consequently, orderliness is evidenced.

Practical values are stable values.

Human beings have opportunities for behaviour throughout their relationships and contacts.

There is no contact or relationship devoid of value.

Every mutual relationship includes expectations. Fundamentally, this is relativity; this is necessity.

Direct perception, inference, and testimony-activity (*agam kriya*) are classified and determined according to what is accessible to knowledge and sight.

Direct perception is the realisation of continuity in proximity. Inference is the possibility of continuity in proximity. Testimony-activity is existence beyond the possibility of proximity.

The infinitude of nature and the completeness of Omnipotence provide evidence of existence beyond inference.

Direct perception takes gross, subtle, and causal forms.

The gross is directly perceptible to ordinary intellect, the subtle to special intellect, and the causal to particular intellect. On this basis, inference and testimony-activity are also established in gross, subtle, and causal forms. Form and property are gross; property and essential nature are subtle; essential nature and dharma are causal. Therefore:

In behaviour and production, tendencies take three forms: (1) independent, (2) imitative, and (3) adherent.

Independent tendencies are active in areas where the person possesses expertise.

Those who wish to acquire expertise engage in imitative tendencies.

Those who have not yet developed the desire for expertise continue to act and behave through disciplined adherent activity. Their condition reflects the combined influence of development and opportunity. Opportunity consists principally of orderliness and education.

Independent action requires the capacity to experience the presence of gross, subtle, and causal activity; imitative action requires this capacity for gross and subtle activity; adherent action requires it for gross activity alone. These levels reflect differences in expressive capacity.

Independent action entails self-regulation; imitative action entails voluntarily accepting guidance; and adherent action entails receptivity to discipline.

In every condition, faults can be removed only through participation in a programme aligned with universal aspiration; such a programme brings auspiciousness.

Coveting another's wealth or spouse, and desiring another's pain, obstruct behavioural, social, and material advancement as well as awakening.

Attachment, malice, ignorance, and conceit have proven to be obstructive to intellectual awakening.

Fear obstructs the development of the capacity required for spiritual experiencing—the experiencing of coexistence.

The wastage of natural splendour causes seasonal imbalance, from which distress arises.

Righteous wealth and marital faithfulness, together with kindness in work, behaviour, and conduct, bring social happiness and balance. Non-accumulation (prosperity), affection, learning, and simplicity bring intellectual happiness; fearlessness brings the realisation of spiritual joy. Together, these are the purpose, thought, and experiencing of the person's physical, intellectual, and spiritual dimensions. They also provide the unifying thread, balance, resolution, and prosperity of the individual, family, society, nation, and international order. This is the universal aspiration for equilibrium.

Through all its actions, humanity has sought to realise establishment in truth, steadfastness in dharma, continuity in justice, and the usefulness of things. This aspiration has produced truth-oriented, dharma-oriented, justice-oriented, and object-oriented endeavours.

Establishment consists in controlling, acquiring, using, and rightly using physical substances; sustaining social values, conduct and their continuity; and attaining enlightenment and realisation of truthfulness and truth. Without these, the human being is neither satisfied nor free from delusion.

The following are well known: wealth acquired through production and service; prosperity through the right-use of wealth; balance through restrained use and right-use; resolution through universal dharma; and realisation and joy through truth and truthfulness.

Experiencing joy is an eternal establishment. Conduct, behaviour, orderliness, method, and education grounded in dharma and justice bring resolution and enduring establishment; an object-oriented tendency can attain only limited establishment.

Activity, karma, substance, process, result, and powers are mutually complementary. Activity is substance; substance is process; process is result; result is powers; and powers are activity and karma. All are evident in substance.

Effort, motion, and continually arising results characterise activity; its projection characterises karma; meaningfulness characterises status; development characterises activity; and usefulness characterises result. Wave, pressure, and effect reveal the state in which power is present. They are projections or transformations occurring within the bounds of substance.

In relative form, material powers are state-dynamic; conscious powers are state-dynamic in the form of expectation. In absolute form, the Spirit—Omnipotence is state-complete.

Material powers are known as heat, light, electricity, attraction, and sound; conscious powers as hope, thought, desire, resolve, and experiencing. The Spirit—absolute Omnipotence—is the foundation sustaining insentient and sentient nature.

In mediating activity, enlightenment and experiencing occur within natural Omnipotence.

Atma is the mediating activity, and Omnipotence is the mediating reality.

Material powers are principally kinetic; conscious powers are awareness-endowed.

Sensation is the capacity to accept absence, presence, and the disappearance of absence. In sequence, absence is felt as pain; presence as humane sensation; and the disappearance of absence as responsive address. This is right enlightenment and a precursor to realisation.

Application and production transform absence into presence. Conduct, behaviour, and orderliness bring presence to its natural completeness; presence itself is the disappearance of absence.

Presence is fundamental distinctiveness, value, and meaning.

The complete meaning of every meaning is realisation. Without awareness, value, presence, and fundamental distinctiveness cannot be determined. Awareness makes it possible to decide and deliberate about an existent state: its direction, time, measure, motion, use, destination, union, separation, decline, awakening, propriety, impropriety, and what is prescribed or prohibited. Until such understanding can be taught universally and fully assimilated, doubt, dispute, and delusion persist, leaving the way open to factionalism and conflict.

Decisive capacity works through causes, properties, and calculation; deliberative capacity is expressed as full awareness of the immortality of *atma*, the mortality of the body, and the rules of behaviour.

Conscious powers are far more capable than material powers. The direct evidence is that no activity can be accomplished through the human body in their absence.

The human being releases a greater measure of power than the fuel supplied to the body.

The capacity of the five conscious powers is evaluated and realised through their mutual relations. The hope-endowed mind (*mun*) realises thought-endowed *vriddhi*; *vriddhi* beholds the mind and realises desire-endowed *chitta*; and *chitta* beholds *vriddhi*.

Chitta endowed with auspicious desire, buddhi endowed with true resolve, and atma fulfilled in the realisation of coexistence are the evidence of awakening. The realisation-fulfilled *atma* beholds resolve-endowed *buddhi*. This is the whole of realisation and complete awakening.

The more-awakened beholds the less-awakened; the less-awakened recognises the more-awakened. Therefore the awakened human being recognises the seeker of awakening, and the seeker recognises the awakened.

The awakened person trusts the seeker, and the seeker maintains discipline in their association with the awakened person.

Only human jeevan displays the distinctions of gross, subtle, and causal life. Across these three states, human beings seek happiness, peace, contentment, and joy.

At the gross level, human beings seek happiness and peace; at the subtle level, peace and contentment; and at the causal level, joy and supreme joy. Awakening is the natural evidence of these attainments. The comprehensive programme aligned with these expectations is awakening, comprising physical, intellectual, and spiritual attainment. It succeeds only through a humane and higher-humane programme.

The powers of insentient and sentient nature operate only through origination, sustainment, and dissolution; property has no other mode of operation.

The aim of every deployment, from beginning to end, is complete awakening.

A unit's capacity for responsive address emerges with the natural completeness of its awakening.

Among origination, sustainment, and dissolution, sustainment alone is universally acknowledged; it is established only in complete awakening. Prior to that, union, separation, and conjunction govern relative behaviour, karma, and activity. These states mark the natural progression toward awakening.

Karma inevitably bears results, and a deluded person becomes subject to its consequences. This universal law makes freedom from delusion about action and its result-bearing nature imperative.

In a deluded state, human beings are uncertain, apprehensive, and ignorant about their karma and its results, although none of these conditions is desired in, from, or for human beings.

When property operates through sustainment, it is mediating; through dissolution, degenerative; and through origination, generative. These correspond respectively to karma directed toward the ultimate good, self-interest, and the interests of others. In behaviour, they become evident in the undeluded, deluded, and deluded-undeluded conditions.

The generative, degenerative, and mediating powers are, in sequence, *rajoguna*, *tamoguna*, and *sattvaguna*.

Through conduct and behaviour, a person endowed with *sattvaguna* expresses wisdom, science, and values such as kindness, respect, and love.

A person endowed with *rajoguna* makes right-use of science together with patience, courage, and good nature.

A person endowed with *tamoguna* wastes scientific capacity and exhibits envy, malice, conceit, and egotism.

Human beings uphold individual and collective dharma by living in accordance with truth-related method and orderliness, thought, conduct, behaviour, education, direction, karma, and methods.

When human beings uphold their own dharma, it manifests as wholeness, universality, and boundlessness. It encompasses coexistence, sociality, prosperity, balance, control, restraint, fearlessness, non-disparity, simplicity, and generosity. It sustains enduring social values such as kindness, affection, generosity, glory, respect, guidance, reverence, love, and gratitude. This is humanity's abiding aspiration and the complete attainment of healthy sociality.

Cooperation and encouragement from awakened human beings, sound education and protection, and favourable circumstances—all directed toward increasing the number of people of righteous character—constitute the evident form of world peace. The opposite conditions are unrest, as is clear.

Righteous character consists in observing the “behaviour-trio.” It confers dignity across the five human states and establishes natural dedication, allowing science and wisdom to reach fulfilment. A sound system of orderliness and education can then become effective.

The “behaviour-trio” comprises the physical, vocal, and mental conduct of an awakened human being.

Result, refinement, and change occur in five contexts:

(1) existence as coexistence, (2) development progression, (3) development, (4) awakening progression, and (5) completeness of awakening.

The material order fulfils its purpose through result, complementing the existent state. The biological order fulfils its purpose through result, with pulsation and nourishment, through composition and complementarity in the existent state. The animal order fulfils its purpose through change, result and the hope to live, complementing the existent state. The human being belongs to the knowledge order, whose tradition advances through refinement toward awakening and complete awakening. This is evidenced as complementarity within the existent state.

In a life governed by enjoyment and excessive enjoyment, human beings cannot attain health themselves or educate the next generation toward conduct-based awakening. This pressing fact is the principal reason for transforming and refining thought. Enjoyment is not the basis of culture.

Without culture, civilisation, methods, and systems of order remain uncertain. The consequences appear as frustration, anguish, excitation, anger, indignation, conflict, rivalry, terror, fear, and distress—none of which human beings desire. Human beings are therefore compelled to move toward what they truly desire. This opens the way to transforming and refining thought and to developing *sanskar* qualitatively.

Qualitative development in *sanskar* becomes evident through observance of the “rule-trio.” Through this method, the capacity to sustain social values through a restrained tendency becomes established in one’s essential nature. Such restraint directly evidences universal orderliness and is verified in life.

This is also the universal aspiration.

Refined thought is science guided by wisdom and expressed as proficiency, skill, and scholarliness.

Every accomplishment arises through application, behaviour, and realisation.

A life governed by enjoyment produces animalistic and demonic human conditions.

A life governed by thought produces awakened and deific-human conditions.

For the divine human, no further result, refinement, or transformation remains; the destination has been reached, and only continuity remains.

A capacity informed by science and wisdom alone can infer the following nested sequence: substance has form; form contains property; property contains effect; effect contains essential nature; essential nature contains capacity; capacity contains motion; motion contains method; method contains orderliness; orderliness contains absoluteness; absoluteness contains Omnipresence; Omnipresence contains sustainment; sustainment contains the world; and Omnipotence contains the world. This is the attainment of the capacity for refinement. Inference precedes evidence.

Science can be applied toward ascent or decline, whereas wisdom operates only toward ascent. Telecommunication illustrates the upward application of science; mechanised systems of warfare illustrate its downward application. Mineral coal, mineral oil, and radioactive substances used as fuel lie at the root of pollution on earth. When scientific power aligned with wisdom is correctly applied, harmful events such as fear and terror do not occur. No harmful effect arises when its purpose accords with wisdom.

A wisdom-filled capacity may or may not arise, but once present it is not wasted. Scientific capacity, by contrast, may either be wasted or rightly used. Science is therefore governed by wisdom, not by science itself.

Progress toward development is upward-facing; compulsion toward decline is downward-facing.

Every stage of development leads toward a further stage and therefore points beyond itself.

Progress toward development brings enthusiasm, happiness, and joy; movement toward decline brings dejection, discouragement, helplessness, and distress.

Science directed upward expresses pure *rajoguna* together with *sattvaguna* and serves sustenance; this is science's actual fulfilment. Science directed toward destruction and excessive enjoyment expresses tainted *rajoguna* together with *tamoguna* and constitutes its complete misuse.

The humane human being and a greater orientation toward awakening are expressions of an upward-oriented life. It embodies kindness, simplicity, renunciation, austerity, benevolence, truth, non-violence, non-stealing, non-possession, and glory, bringing wellbeing to oneself and others.

A life shaped by wicked character is overcome by terror and fear, producing pain for oneself and others. This fear arises from the inhumanity within the human being and lies at the root of asociality and non-coexistence.

Affection for the human family sustains trust and contentment and encourages further development.

No relationship can succeed without trust, and no karma can be fulfilled outside relationship.

Trust alone enables social values to be lived successfully.

Just behaviour, thought grounded in resolution, and a life fulfilled in Experiencing Truth are free from affliction; together they constitute universal wellbeing.

Only science applied under the guidance of wisdom can make life in every human state wholly beautiful. Such an orientation to karma and such attainment benefit all humankind and constitute universal wellbeing.

A tradition of karma endowed with wisdom and science, both aligned with knowledge, alone constitutes karma for universal wellbeing. This is humanity's abiding hope and aspiration, as well as its necessity and occasion.

"May there be universal wellbeing; may there be everlasting wellbeing."

Chapter Two

Upasana (*upāsanā*) – Wisdom

Knowledge: — knowledge of the holistic view of existence, knowledge of jeevan, knowledge of humane conduct

Wisdom: — the immortality of jeevan, the mortality (*nashwaratva*) of the body, the rules of behaviour — together with knowledge — being evidenced in the human goal and the jeevan goal

Human goal: — resolution, prosperity, fearlessness, the natural evidencing of coexistence

Jeevan goal: — happiness, peace, contentment, joy

Upasana is an important part of human jeevan. It is the process of refining and transforming the fundamental tendencies, and this study also transforms *sanskar* and essential nature.

Upasana is naturally conceived as attaining togetherness through proper means. This requires diligence (*pariśram*, refined effort) and practice. Through practice, diligence, and study, the veracity of the gross, subtle, and causal becomes clear. Research into the relevant matter, the course of destiny, power, magnificence, special powers, and their governing rules—conceived through *anugaman* (the path to realisation)—is thereby established. Research differs across the physical, intellectual, and spiritual domains, and manifests directly as ratiocination, contemplation, resolve, and experiencing.

The gross, subtle, and causal (the Seer) together mean being endowed with the capacity to see, understand, apply, behave, and realise.

Upasana is of three kinds: *kutastha* (abiding in the immutable), *rupastha* (abiding in form), and *atmastha* (abiding in the self). The process undertaken for complete realisation is *kutastha upasana*. The process undertaken to approach a form endowed with magnificence is *rupastha upasana*. Reflection itself is the process of *atmastha upasana*, to which the human being is bound. The refinement of tendencies is therefore the programme of human jeevan. The aspiration for completeness and the capacity for refinement are present in every state of the human being. The capacity for refinement comprises skill, proficiency, and scholarliness; its completeness is scholarliness. Nothing in knowledge and skill surpasses scholarliness, just as nothing in behaviour and production surpasses proficiency. The capacity for refinement is expressed in production and behaviour. Scholarliness is full awareness, and full awareness is education and orderliness. Until one is fully established in it, upasana remains an extremely helpful aid.

Deities (*devi-devata*) are classified into three kinds: terrestrial, cosmic, and celestial. This classification is based on their capacity for movement. The conscious unit is the combined form of subtle and causal activity. This is the jeevan-cloud (*jeevan-punj*); the deities are none other than this. The gross body is controlled by *pranavayu*, subtle activity by chitta, and causal activity by atma. The subtle and causal are never separated; this bears witness to immortality. Their signals become evident only in their operation of the gross body, and this operation is indispensable. In a state without the gross body, subtle activities are carried out solely according to signals from buddhi.

The three kinds of deity are: celestial (moving through limitless expanse), cosmic (moving within the expanse of a single cosmos), and terrestrial (moving only within the environment of a single earth). These correspond, respectively, to the divine self, the deific self, and the elemental self.

Complete conduct together with complete awakening characterises the divine self; alertness together with complete activity characterises the deific self; and intense attachment to objects, accompanied by apprehension and fear, characterises the elemental self. After a change of body, the demonic human and the animalistic human are reckoned as elemental selves; the humane human and the deific human are reckoned as deific selves; and, after relinquishing the body, the divine human is reckoned in the category of the divine self.

Elemental selves are in a state of absolute-oneness (*tadatmya*) with adhibhautik elements, deific selves with adhidaivik facts, and divine selves with the Spirit (*adhyatma*). Accordingly, these three categories are established.

In the adhibhautik domain, behaviour is dominated by production; in the adhidaivik domain, production is guided by behaviour; and in a life filled with the Spirit, realisation-based thought, behaviour, and production follow in direct sequence. Behaviour and enterprise are therefore restrained and controlled in a life filled with the Spirit, orderly and disciplined in an adhidaivik life, and undisciplined and disorderly in a physical life. Only a life filled with the Spirit integrates the human being's four dimensions.

Absolute-oneness with adhibhautik elements serves the “instincts-quad” (*vishaya-chatushtaya*); absolute-oneness with adhidaivik social and behavioural values serves the “motive-trio” (*eshana-traya*); and the divine human attains absolute-oneness with the Spirit. Attachment, upasana, and dedication are employed, respectively, for these three.

The whole of insentient and sentient nature is saturated in Paramatma (Omnipotence); within this existence, the three kinds of self are therefore bound toward awakening culminating in realisation.

The deluded human is evidently afflicted, excited, or bound by relativity. This relativity remains observable only until the unit becomes free from delusion, its state of supreme excellence.

Control encompasses rule, inspiration, coordination, relativity, effort, motion, result, activity, conduct, union, separation, combination, status, state, and control itself; all are observable.

Upasana of divine selves is learning (*vidya*); upasana of deific selves is sub-learning (*upavidya*); and upasana of elemental selves is base learning (*kshudra vidya*). Upasana of divine selves is undertaken, with awakening, for freedom from delusion together with intellectual resolution and material prosperity; upasana of deific selves for intellectual resolution and material prosperity; and upasana of elemental selves for materiality alone.

Every jeevan is endowed with its own essential nature, which constitutes its standing. No further manifestation of essential nature is possible beyond this.

Materiality alone has not proved sufficient for the human being, because material substances cannot satisfy the four human dimensions. Until production, behaviour, thought, and experiencing are fully integrated, the human being therefore remains bound to application, endeavour, and practice.

The upasana of divine selves directly yields science filled with wisdom, austerity (firm dedication), determination, decision, and the capacity for resolve. The upasana of deific selves yields partial wisdom, science, patience, courage, affection, trust, renunciation, and control and restraint in the activities of jeevan. The upasana of elemental selves yields science without wisdom, impatience, recklessness, attachment and malice, apprehension, and uncontrolled activities of jeevan. These three upasanas lead, respectively, to alertness-filled watchfulness, awakening-filled watchfulness, and apprehension-filled non-awakening—the delusion-free, semi-deluded, and deluded states.

A body constituted from *rasayanik* (chemical) substances and containing a brain is meat substance; plants provide vegetable substance. Their chemical substances are predominantly similar, yet the formation, mechanisation, and use of the meat-body differ fundamentally from the formation process and use of plant forms, as follows:

Meat-body	Plant-image
1. Seed — egg-born (<i>andaj</i>), body-born (<i>pindaaj</i>)	sprout-born (<i>udbhij</i>)
2. Purpose — medium for the conscious unit's natural tasting and welcoming process	medium of medicine and food (for animals and humans)
3. Mechanisation — body formation with a brain	form-formation without a brain

Meat-body	Plant-image
4. Usefulness — fit to be a medium for the tasting-activity that operates the conscious unit	unfit for operating consciousness, but fit for use and complementarity
5. Occasion — occasion for the sanskar, transformation, and refinement of the conscious unit	occasion for transformation via chemical impulse (<i>urmi</i>)

Milk	Liquor
1. Origin — an outcome that emerges with affection, through the digestion of food in the animal's body	a distilled fluid substance, produced through a degeneration-filled process of sweet substances
2. Usefulness — a nourishing, unctuous fluid substance, succour-giving (<i>tranad</i>) and life-giving (<i>pranad</i>), that balances the heart and the brain	useful as medicine; as a drink, a substance that gives succour and life-breath yet also depletes, removes nourishment, causes delusion and confusion, stimulates, and unbalances the heart and brain
3. Effect — ordinary motion-giving and nourishment-giving	excitation-filled motion-giving
4. Worth — increasing of sensitivity, and nourishing	decaying of sensitivity, and depleting
5. Indispensability — indispensable in humaneness and higher-humaneness	not indispensable

In meat-eating decorum, forceful slaughter and exploitation are inherently embedded events.

Within inhumaneness, vegetarian and non-vegetarian human beings differ in decorum, conduct, behaviour, and tendency, yet their purposes remain predominantly similar; the same is evident among animals. Therefore:

when humaneness becomes available for study and is understood, both non-vegetarians and vegetarians agree in its favour. Once established in dedication, even the non-vegetarian becomes vegetarian. Trust and expectancy are alike in awakened human decorum. This is the point of truth toward which every kind of decorum waits for the establishment of human decorum—a site of possibility for the continuous excellence of awareness.

Humaneness and higher-humaneness make the originality of vegetarianism clear. Human decorum attains oneness—freedom from diversity—only through humaneness. The chief utility of upasana therefore lies in immersion in universal values.

Upasana methods whose resulting decorum establishes class-sentiment do not fully support comprehensive resolution, because class-sentiment ultimately tends toward conflict. Universality is indispensable to freedom from conflict.

All upasanas share a common aim: undivided society, universal orderliness, and universal welfare. Without the aspiration for universal welfare, one's own welfare cannot be accomplished.

Other desirable aims provide only the appearance of welfare, not its realisation. The human being is therefore bound to endeavour toward a programme aligned with universal welfare and to develop the capacity required to follow it.

Only the universal, humane observance of the intellectual, social, and natural “rule-trio” makes freedom from economic and communal class-sentiment possible and actual. All class-sentiment dissolves through this method. Upasana therefore becomes meaningful only through the desired understanding together with awakening.

The human being possesses three powers: activity-power, desire-power, and knowledge-power. These qualifications rest on each unit's capacity for awakening and its actual awakening.

Upasanas exist only to develop the capacity for awakening, not for decline.

The progress of awakening involves no pain; it is the music or integrality of jeevan. Every kind of pain arises instead from wrongful activity and decline, and these constitute sorrow.

Pain may be intellectual, behavioural, or physical, and is observable as problem, offence, incapacity, and wastage. This is the direct form of non-awakening.

Deficiency in watchfulness and alertness is the cause of all affliction. Watchfulness and alertness manifest only on the basis of the capacity, ability, and receptivity present in the human unit. Therefore:

The awakening of activity-power means putting powers to right-use rather than wasting them through the sense-organs of sound, touch, form, taste, and smell. Within humaneness, the “rule-trio” determines right-use and wastage.

Only human consciousness and higher-human consciousness prevent the wastage of the *antahkarana*’s fundamental tendencies—hope, thought, desire, and resoluteness (*ṛtambharā*). This right-use is the awakening of desire-power.

Right-enlightenment together with complete experiencing provides the capacity to manifest knowledge. This is the awakening, or complete awakening, of knowledge-power. The resulting “awakening-trio” becomes directly evident in humaneness and higher-humaneness. It is the supreme attainment of human jeevan, the utility of empowered upasana, the aspiration of humankind, and universal welfare.

Jeevan-awakening directly manifests as the application of science filled with wisdom. It comprises watchfulness, undivided sociality, full awareness, freedom from disparity, coexistence, education, method, orderliness, civilisation, culture, intellectual resolution, material prosperity, and the continuity of jeevan-awakening.

Every human unit is bound to endeavour and upasana until complete awakening. These refine the fundamental tendencies, allowing a distinctive and cultured mentality, the capacity for thought, contemplation, and enlightenment, and complete realisation to manifest. These are the attainments of the best upasana and constitute completeness of study.

One who completely knows a discipline and is practised in its work, behaviour, and realisation remains continuously active in it. The completeness of an activity is therefore its continuity. It neither causes indifference nor makes another indifferent, because activeness exists for the sake of completeness, and completeness is continuity of activity.

Whatever acts for the sake of completeness continues after becoming complete, as seen in complete activity and complete conduct. Completeness cannot be measured by incompleteness, nor the awakened by the unawakened, because the lesser value is contained within the greater, not the greater within the lesser. Every human being can measure what is less developed, can produce together with less-developed nature, and can gain knowledge of what is more developed. The human being is therefore bound to behave with equals. This is the imperative of sociality and the natural glory and dignity of human jeevan. That dignity provides the impetus to behave with one's equal and to practise toward greater awakening; this is real upasana.

Wisdom—the human goal—and jeevan-value—resolution and prosperity—are the direct results of upasana, within which sociality is naturally contained.

Realisation-enlightenment projects as non-accumulation (prosperity), generosity, and kindness. Enriching the natural foundational values of generosity and kindness is the life-essence of sociality and its music; this alone is what the human being thirsts for. Wisdom manifests intellectual resolution and social values through sustaining them.

Wisdom and science are the chief characteristics of indirect knowledge (good-behavioural knowledge). Realisation is its final state; before realisation, only the authority of inference is established. Realisation exists only in the truth of the existent state, the objective, and the state.

Without indirect knowledge, no discernment of the eternal and non-eternal, proper and improper, just and unjust, righteous and unrighteous, true and false, desirable and undesirable, or seen and unseen is established; nor is the authority of indirect knowledge itself.

Without authoritative knowledge of the eternal and non-eternal, the human being cannot dedicate oneself to one's own-dharma. Human dharma is happiness; happiness is just conduct; and just conduct is the observance of humane conduct and the "rule-trio." This is the human being's own-dharma. The human being is happiness-natured.

No unit is without propriety. Animals do not violate the propriety of essential nature, plants the propriety of property, or substances the propriety of form; this is their dignity. Likewise, resolution-happiness is dharma in the human being, and dharma is propriety. This is human dignity and trust; trust is the direct form of propriety.

"There is no happiness in relationship and connection devoid of trust." No human being is without relationship and connection; hence the imperative of one's own-dharma. Any deficiency of capacity, ability, or receptivity in its observance becomes sorrow, affliction, problem, and non-awakening.

Until one becomes fully complete with fullness in one's own-dharma and with the capacity, ability, and receptivity fit to observe it, there is no absence of upasana in the form of study, for the purpose of acquiring knowledge.

Creed, sect, and class disappear only in the human being's own-dharma. This is the direct dignity of capable upasana: "This is auspicious." Upasana must contain the aim, seeker, and means together; their integrality brings success, and their separation brings failure. The right-use of whatever power and means are available in each state advances awakening; this is upasana.

There is no such power or means which has no deployment or use, because the accumulation of power or means is not practical.

Self-delight is grounded in wisdom; wisdom-filled buddhi grounds science; science informs art, composition, discernment, and thought; discernment guides tasting and welcoming; and the sentiment-filled mind remains continuously balanced and resolved. Consequently, atma is suffused with supreme bliss, buddhi with joy, chitta with contentment, vritti with peace, and mun with happiness.

The activities of the sense-organs and their field of operation define the boundary of direct knowledge. Within this domain, attainments related to the four objects are its outer limit; nothing beyond them can be attained through it.

The human being is not confined to the domain of objects, because four dimensions are established within the human being.

The human being alone is bound to accomplish production, behaviour, thought, and experiencing. These constitute necessity, occasion, possibility, and orderliness.

Through restraint alone, dignified grandeur manifests in every sphere of human activity, as follows:

Mastery in speaking truth, grounded in enlightenment of truth, ends fear and distrust and gives rise to delight and enthusiasm.

Mastery of non-violence brings freedom from the fear of opposition and gives rise to affection and generosity. Non-violence means not participating in violence, whether done, caused, or intended, and whether physical, vocal, or mental.

Dedication to non-possession destroys pitiableness and baseness and gives rise to patience, fortitude, and generosity.

Establishment in non-stealing destroys cunning and distress and gives rise to satisfaction and contentment. Non-stealing means not committing theft.

Establishing value (sentiment) toward the world removes disparity between the desired deity and the seeker; the essential nature of that deity thereby enters the seeker.

Through the practice of consistently remembering the meaning of a word—that is, of a mantra—its meaning and essential nature become attainable. Every meaningful word is a mantra.

Greater dedication to awakening eradicates pride and ego and gives rise to learning and simplicity.

Restraining physical sensitivity brings purity of mind, from which mental strength arises.

Destroying attachment to one's own body removes attachment toward the world. Only an intellect filled with a trustworthy aspiration for universal welfare can pour generosity, kindness, grace, and compassion into the world and attain knowledge and realisation of coexistence in the world's foundational Omnipotence.

Without restraint, there can be no refinement of the fundamental intellectual tendencies, no strength of intellect, no realisation of social values, no vision of conscious activity, and no resolution or restraint.

“Gratitude alone is the beginning-to-end basis of restraint.”

Ingratitude directly evidences lack of restraint. Gratitude must be cultivated from infancy and adolescence.

Continuous kindness-filled thought remedies miserliness and enables the experiencing of supreme delight.

When the *antahkarana* (mind, vritti, chitta, buddhi) is brought into absolute-resonance with an aim, it becomes intense in that very aim. Thus, by attaining absolute-resonance with water, distress is dispelled, giving rise to the experiencing of satisfaction.

By attaining absolute-resonance with fire, disease is dispelled and health is gained.

By attaining absolute-resonance with air, instability is dispelled and stability is gained.

By attaining absolute-resonance with light, ignorance is dispelled and knowledge arises.

Contemplation of others' welfare increases enthusiasm and delight.

Benevolence toward others brings fame.

Resolving problems brings glory.

Contemplation of universal welfare develops talent.

The practice of recognising others' virtues destroys one's own vices.

A biased intellect is incapable of grasping the virtues of the opposing side, because it is not free from envy, malice, hatred, neglect, and delusion.

The progression of awakening contains no self-versus-other faction; orderly sequence, rule, and justice are therefore accomplished within it. The absence of full awareness is the cause of problems, and full awareness—awakening—is their sole remedy. This is the direct dignity of upasana.

Environment is indispensable to upasana, especially the human-made environment of education and orderliness.

Education imbued with full awareness gives personality its direction and magnificence. The orderliness capable of protecting and promoting it is sovereignty.

The generalisation of full awareness is the direct form of qualitative change. What one person attains through upasana becomes common through education and orderliness.

Without the perspective of qualitative change, the deluded human being evaluates solely by measure. This gives rise to class struggle and conflict.

Personality is the conduct of the “rule-trio” natural to humane behaviour. Actively contributing to such personality is duty, human endeavour, and full awareness.

Upasana directly gives the individual personality and duty because it is, by nature, education and orderliness. It is therefore full awareness; in the human being, full awareness is education and orderliness.

There is no diversity in truth and truthfulness.

Symbols are multiple and indicate only delusion.

An intellect that mistakes the symbol for the goal gives rise to communal excitation, pride, and ego.

To the extent that it is incomplete, symbol-and-goal-oriented upasana proves secondary and unsocial because it neither clarifies nor attains the human goal. Disparities therefore arise. Such symbols are distinguished by place, caste, language, art, image, composition, statue, memorial, and word.

Intellectuality, not the body, directly manifests human personality, because the intellectual capacity of each individual receives respect or neglect, honour or contempt, and esteem. Intellectuality is therefore the seat of the fundamental tendencies and the capacity to receive and transmit signals. It encompasses necessity, desire, thought, attachment or non-attachment, refinement, effect, readiness, and intellectuality itself.

Natural and capable upasana is an indispensable human programme, establishing the progression from inhumaneness to humaneness and from humaneness to higher-humaneness.

Within coexistence, natural-recurrence arises through the moment-to-moment unbroken tendency (*anukshan-vikshan-vritti*).

The moment-to-moment unbroken tendency is the disappearance, at every moment, of mediating obstruction.

Anukshan means that contemplation of coexistence continues at every moment and authenticity naturally becomes evident in the course of thought. This is natural-recurrence.

Complete knowledge of nature saturated in Omnipotence — the complete holistic view — is the disappearance of mediating obstruction at every moment. It dispels deluded notions of presence and absence and establishes natural standing and state.

In the absence of natural knowledge of nature saturated in Omnipotence, and of realisation-rooted knowledge, fear and temptation sustain all delusion-rooted activity, behaviour, and thought. This causes all affliction.

Time is the duration of activity. Within this duration, imposed thought and desire are unnatural, while non-imposed thought and desire are natural.

Only the human unit possesses the capacity for non-imposition, even during the progression of awakening. Imposition arises from delusion.

To regard what is as more than it is, less than it is, or not to understand it is imposition. This is ignorance, incapacity, and delusion.

Imposition or non-imposition occurs only in relation to the stable state of insentient and sentient nature saturated in Omnipotence, and to the natural completeness of Omnipotence.

Every unit comprises form, property, essential nature, and dharma; this is its functionality. Knowledge of their count, measure, and purpose indicates a capacity dependent upon nature. This is the evidence and the naturalness of that capacity.

All activities are fundamentally observable through the distinction between form and word.

Without complementarity, there is no advancement in a unit.

Until completeness, the unit remains inclined toward complementarity and usefulness.

Complementarity manifests the characteristics of decline and development in the unit; this is also its chief utility.

The properties beginning with sound that manifest in a unit are relative powers. No unit is without property. Therefore:

Natural aspiration is present in every human being. Naturalness is dharma and manifests as happiness, peace, contentment, and joy. It clarifies conception directly.

Every result of karma has proved capable of either nourishing or exploiting human happiness.

The realisation progression of truth and truthfulness meets no obstruction because its orderliness and the links of awakening are dense. Therefore:

Naturalness is free from imposition. Imposition is deficient or excessive evaluation, and deficient or excessive self-evaluation is unnaturalness.

Self-evaluation occurs within the domain of the “-*tā*-trio”.

There is no human being on this earth who does not fall within the domain of the “-*tā*-trio”.

There is no separation from dharma, because conception belongs to dharma itself. Its direct form is humane and higher-humane conduct, the chief characteristic of naturalness. Conduct that advocates inhumaneness is therefore unnatural.

Nature is complete within itself; this is duration and is contained within the whole. It is coexistence, natural to completeness within the whole: the ever-presence of completeness and its emergence in the human being through knowledge. This makes awakening imperative.

Removing unnecessary imaginings from the human intellectual domain qualitatively refines the capacity for the holistic view. This is the combined outcome of qualitative *sanskar*-transformation, education, and the programme of jeevan.

The excellence of the capacity for the holistic view is the moment-to-moment unbroken tendency. This is the capacity of mediating activity, and mediating activity is the Seer.

Mediating activity culminates in complete control of generative and degenerative activity. This capacity is freedom from moment-to-moment mediating obstruction.

Through *sanskar*, the human being engages the capacity for intellectual orderliness, through activity and cessation, within the domain of natural desire and objects.

The intellectual process and orderliness aligned with atma (mediating activity) manifest truth-reveal and a mentality filled with truth-imagination, renowned as completeness in the knowledge of karma and upasana. This capacity manifests deific and divine humaneness; it is complete awakening.

Intellectual orderliness attached to desire manifests humane and deific-human essential nature, together with a corresponding mental environment. This capacity—social consciousness—becomes complete through alertness and watchfulness.

Object-attached tendency and process give rise to inhumane conduct, observable as bestiality and demonic-ness, together with a mentality suited to those conditions. This causes latent and dormant imagination and indicates non-awakening and incomplete watchfulness.

Latent and dormant imaginings are refined only when one becomes inquisitive toward the good (awakening). Indifference toward demonic and bestial tendencies is thereby established, and wisdom arises.

Inquisitiveness toward the good arises through one's own *sanskar*, method-prescribed study, and a favourable environment.

Method-prescribed study develops skill, proficiency, and scholarliness.

Study and environment form the orderliness capable of *sanskar*-transformation; their qualitative change is inquisitiveness for self-enlightenment.

Self-enlightenment is the chief characteristic of inquisitiveness for truth. Therefore:

Conception is the inclination toward *anugaman* and cultivation, manifested as decorum.

For progress, conception is indispensable.

Conception leads toward awakening and attachment toward decline; they correspond, respectively, to cessation and unnecessary tendency.

Conception is right-wisdom, and right-wisdom is the discernment of truthfulness. At root, it is universal goodness and welfare.

The conception of realisation takes the form of truth-enlightenment, and conception as right-enlightenment is truth-resolve. When projected, it bears fruit as good karma, upasana, and conduct. Its projected value manifests as courage, valour, generosity, kindness, grace, and compassion.

Right-enlightenment occurs only in truth; falsehood gives rise only to imagination and appearance.

Karma joined with baseness, wretchedness, and cruelty is inauspicious.

Self-value brings satisfaction in both activity and cessation. Therefore:

Karma and upasana free from falsehood, pride, and arrogance, and joined with truth, simplicity, naturalness, and courtesy, give rise to the good.

Continuity in the aspiration for truth gives rise to the conception of the goal. Production, behaviour, thought, and experiencing manifest directly only in knowledge.

Knowledge is complete science sanctioned by wisdom.

Firmness in truth and truthfulness constitutes a jeevan filled with the good.

The experiencing of truth is everyone's desired end (*abhīṣṭa*).

It is the mind alone that operates, through the brain, all the activities accomplished by the body. All the nerves are controlled by the brain.

Mind is the fundamental form of word. Through the brain, mind transmits, operates, and controls waves filled with the sentiments of tasting and welcoming; word lies at their root.

A word that guides movement toward awakening is a mantra. Control is the process that orders the sequence toward attaining the goal. The sentiment or value contained in a word is its meaning. Meaningful words direct movement toward awakening because the meaning of a word is an entity in existence.

The indispensability and usefulness present in sentiment constitute its importance. The definite direction within such indispensability constitutes its firmness, or right resolve. Completeness in right resolve is realisation. These are the cultivated fundamental activities of mind, vritti, chitta, buddhi, and atma, respectively. The meaning of sentiment lies in its being.

Activity-power as *kāśā*, desire-power as *ākūti*, and knowledge-power as *medhā* are the directly manifest divine intellects. Their arising alone evidences mental strength, intellect strength, and atma strength.

Without the awakening of the powers-trio—desire-power, activity-power, and knowledge-power—renunciation (freedom from delusion) and love cannot be evidenced.

Body-centred jeevan gives rise to beings other than the human; mind-centred, intellect-centred, and atma-centred jeevan give rise to the human being alone.

Without freedom from delusion (renunciation) and a love-filled jeevan, there is no welfare of self and other.

The meaning of welfare is the natural continuity of awakening.

Without karma, upasana, and knowledge that are beneficial to self and other, peace does not become complete.

In a jeevan filled with dispassion, absence itself disappears. Dispassion alone leads to the atma-goal.

The influence of the atma-goal gives rise to self-enlightenment.

Self-enlightenment gives rise to self-illumination.

Self-illumination gives rise to self-trust.

Self-trust brings the decay of ignorance.

The decay of ignorance gives rise to self-standing.

Self-standing gives rise to supreme-detachment.

Supreme-detachment brings the accomplishment of dominion.

The accomplishment of dominion brings supreme opulence and complete satisfaction.

The attainment of opulence gives rise to natural-recurrence.

Natural-recurrence brings realisation of freedom from delusion.

For the human being, realisation of freedom from delusion is the ultimate human endeavour.

This is complete awakening and the standing of the Seer's plane.

“May there be eternal good, may there be good for all.”

Chapter Three

Coexistentialist Science (सहअस्तित्ववादी विज्ञान)

1. Coexistence is eternally present
2. Coexistence is eternally effective
3. Omnipresent reality is permeative and transparent; entire nature (units) submerged in omnipresent reality, order with selfhood, participation in the overall order
4. Complementarity, utility
5. Relationship, value, evaluation, balance

3.1 Atomic Structure and Molecular Composition (परमाणु संरचना एवं अणु रचना)

Human beings have long desired to understand atomic structure.

By the method of decomposition, the human being used thought, reflection, and application in order to reach the fundamental substance. Even at the end of decomposition, the expectation of some definite fundamental substance remained.

This line of thought led to the following conclusion: if any substance is repeatedly decomposed, a state is eventually reached in which the resulting units function in a self-motivated (*svayams-phurt*) manner. Such a functioning unit is called an atom. Human beings have also sought to understand how it functions.

An atom has one or more particles (*ansh*) at its centre and one or more particles revolving around it in orbits. There is no atomic constituent below this level. The possibility that the number of particles at the centre or in the orbits may increase arises only in human imagination.

Two main questions arose in this connection: (1) How is mutual recognition established among atomic particles? (2) Having recognised one another, why do they enter into orderliness? Further reflection showed coexistence to be the principal cause. Every unit is submerged, saturated, and enclosed in the omnipresent reality (Omnipresence), and is thereby energised. Omnipresence permeates them all. Thus, from the subtlest to the largest unit, being saturated in Omnipresence is the basis of being energised. To be energised is to be forceful and endowed with magnetic force. By virtue of this forcefulness, even the subtle atomic particle has the propensity to recognise others and participate in orderliness. Human beings need to accept mutual recognition as evidence of this strength. Human beings alone possess the innate right to recognise propensity, action, and outcome. When they recognise one another, they present themselves within orderliness. When they err in recognising this meaning, they function and behave within disorderliness, and the problem

arises. Thus every atomic particle, by virtue of being saturated in Omnipresence, functions within orderliness through mutual recognition. The functional expression of orderliness is definite conduct.

Because every atomic particle is energised, mutual recognition is natural to it; the purpose of that recognition is combined conduct. This was understood as an eternal law. A further formula follows: constitution and organisation arise only through such recognition, and their ever-present meaning is orderliness. It is therefore easy to understand that every complete unit is indivisible within the omnipresent reality, and that this indivisibility is coexistence. Human beings can accept that coexistence is eternally active.

Coexistence itself became the fundamental formula and the basis of orderliness. At the root of every state of motion, coexistence is well established. In this way it became clear that coexistence itself is the basis of the diverse action (activity) and of the conduct of each one of them.

Differences in conduct arise only from differences in the number of functioning particles in atoms. On this basis, human beings have attempted to determine the species of atoms and their number. They have so far proposed 108 species of atoms on earth and continue to hope that another species will be discovered.

On understanding the atom in this way, we humans become clear in an orderliness-centred mindset. As a result, it became natural for the human being to be ready to recognise the innate orderliness within himself. In this progression it became natural for the human being to understand humane conduct. From this it is found that value, character, and morality — their combined expression, communication, and manifestation — have, within the human tradition, the basis of orderliness, from it, and for it.

This fact applies throughout the animal, plant, and mineral orders, in all the species reckoned in solid, liquid, and rarefied forms: the atom is at the root of them all, and jeevan too is an atom. The atom of every species performs definite conduct. The human being, as the combined form of jeevan and body, therefore also wishes to live within orderliness through definite conduct. The grandeur of atomic structure becomes clear only in conduct, and conduct is expressed through its activity.

Atomic composition also makes clear that atomic particles become evident only in coexistence with one another. A particle that remains separate in the limitless void (Omnipresence) cannot evidence the intent of orderliness. It therefore continues whirling in the limitless void in search of another particle. Ultimately it is absorbed into another atom or forms a definite atom with another atomic particle. Orderliness thus becomes manifest only after an atom is constituted, and conduct becomes manifest through that orderliness. This is evident in physical, chemical, and jeevan activity-processes.

That atomic structures are based upon one or more particles has already become clear; this too has become clear: that the atom of every species is self-actuated. Their conduct is definite.

Every atom consists of a nucleus (*madhyansh*) and particles functioning in orbits. At least as many particles are present at the centre as in the orbits, and there may be more. Here, “orbits” means the paths of particles circling the centre; an atom may have one or several. When there are more than four orbits, there is always the possibility of decrease, and when there are fewer than four, of increase. Such atoms exist as their respective species in various numerical states. Their weight depends on the number of particles inherent in the nucleus. Atoms endowed with inherent weight recognise one another and gather together; this is called a molecule. Molecules occur in solid, liquid, and rarefied forms. Solid compositions are evident in large formations such as the earth. Liquid substance is considered the initial substance of the chemical world. All these are constituted through compounding. Human beings do not contribute to this process; they only study it. Study is necessary because it enables recognition of the innate functional orderliness in these units. The activity-process of biological cells, as an outcome of the composition of the nourishment-element and composition-element, becomes clear only on the basis of chemical substances.

Atoms and molecules alone perform the physical-chemical activity-process. A molecule therefore works continuously within orderliness. Its continuing state of motion is evidence of that orderliness.

Every atom and molecule is a rung of its own species. What is meant by being a rung is its existent-state, its continuity. Just as two particles are in one existent-state in the form of an atom. This is one step. Their having definite conduct is itself their grandeur. This very having of definite conduct becomes the basis of the further step, and remains so. Atoms and molecules with various numerical particles remain with their definite conduct established. This is a wondrous self-motivated form of orderliness, clear before the human being.

Each physical atom and molecule that participates in chemical activity can be studied as a state of motion. Their combination becomes evident in large compositions such as the earth. This indicates that, before chemical action could begin on earth, all the necessary species of atoms and molecules were brought together by the destiny-borne innate method — the method of coexistence. The propensity and processes of compounding are accomplished only after atoms and molecules of all species are present. The earth itself is well-established testimony to this.

All these manifestations in the material order are based on species of atoms and molecules, and those species depend on the number of atomic particles. Changes in that number continually produce corresponding outcomes. This activity-process is called absorption-displacement (*prastha-pan-visthapan*). It occurs in atoms to fulfil a result-oriented intent and, in doing so, also fulfils their complementarity. Before a particle is displaced, its atom remains excited; only this excitation makes displacement possible. The displaced particle is then absorbed into another atom. After displacement, the former atom enters natural-state motion; after absorbing the particle and swelling, the receiving atom also establishes natural-state motion. Every atom, molecule, and molecular composition fulfils definite conduct only through the establishment of natural-state motion. Definite conduct is evidence of orderliness, and the intent of development is contained in this progression.

3.2 Development Progression, Development (विकासक्रम, विकास)

The development progression establishes molecules, atoms, and molecular compositions of many species, such as the earth and other planetary globes. These compositions exist in solid, liquid, and rarefied forms, all three of which are well established on earth. Water, as a liquid substance, is the first grandeur of compound action. Through combinations on the earth, water gives rise to acids and alkalis. Once these arise in sufficient measure, cosmic heat and reflection — the basis of mutual recognition — enable nourishment-element and composition-element to form within the water. Their earliest form is called algae (*kaai*). From algae, compositions made of biological cells develop through single-celled, two-celled, and multi-celled forms. This exhibits the development progression in composition. The earth also contains compositions of many sizes in the forms of soil, stone, gems, and metals. Compositions made of biological cells are the grandeur of compound action and are called the plant-order. The plant-order is indivisible from the earth and remains joined to it.

Thus, the combination of diverse substances on earth accomplishes the grandeur of compound action: a festival of forms becoming manifest as distinct from their roots. This is chemical resonance (*rasayanik urmi*); the festival of chemical substances is called resonance.

Every biological cell contains prana sutras, definite measures of the composition-element and nourishment-element, and an inherent composition-method. Prana sutras carry out accretion within themselves and multiply into sutras like themselves. This requires the availability of chemical substances and the conjunction of a definite degree of heat. In the bodies of living beings, including human beings, biological cells form in the marrow-filled fluids within the hollows of bones and are distributed according to the body's needs. The combination of prana sutras also forms many further sutras and cells. Together with chemical substances, these cells preserve their existence as blood and participate in composing the body. In the plant-order, the activity-processes of leaves and roots accumulate sap within the circulation system,

from which biological cells continue to form. The development-propensity of compositions is thus contained within biological cells. The diversity of present compositions is evidence of this development progression, which has reached the grandeur of the human-body composition on earth.

Biological cells manifest compositions as plants of many sizes — trees, creepers, and shrubs — and further as the bodies of living beings. As biological cells in the plant-order develop, they express changes in the composition-method. These changes become the basis of living-being bodies, extending up to the human body. Four orders are perceptible in nature (*prakriti*): the material order as soil, stone, and so forth; the biological order as trees and plants; and the animal and knowledge orders as the combined form of body and jeevan. The composition progression of biological- and animal-order bodies also includes the sweat-born world. When residues of the plant-order, such as dried leaves, collect and receive water and heat, many worms and insects arise spontaneously. This develops further into the egg-born world, through which propagation is established. The sweat-born world appears among water-, land-, and sky-dwellers. The more powerful egg-born world appears as birds and as large water- and land-dwellers. It leads into the womb-born world, whose composition develops from within the egg-born world. Through the egg-born and womb-born worlds, the analysis and synthesis of chemical substances into the seven metals becomes established up to the composition of the human body.

From the study of the progression of all these compositions and of the human body, this too is learnt: that in the human body the richness of the brain (*medhas*) composition has completely and fully become clear. The evidence of this is precisely that in the human being, imaginativeness, freedom-of-action, and its satisfaction, in the form of knowing, believing, recognising, and carrying-out through the medium of the brain, is a unit worthy of expression. The non-human order is limited up to recognising and carrying-out. The basis of recognising and carrying-out is forcefulness itself. This very energy-fullness, forcefulness, has already become evident, in the living human being, in the form of knowing, believing, recognising, and carrying-out. This is also testimony to the brain system being rich. By the above method the outline of there being development in compositions becomes known. Before this it has already been made clear that

development occurs only in the atom. A developed atom is constitutionally complete; this conscious unit is jeevan. By keeping the body alive, jeevan evidences understanding.

3.3 Development in the Atom (परमाणु में विकास)

The preceding account has clarified the development progression in composition from atoms and molecules through molecule-composed bodies, the plant-order, animal bodies, and the human-body composition. The human body can be studied as the most highly developed composition.

The human body is the most highly developed composition because its brain composition has fully developed. Human beings have long desired to unveil the facts of justice, dharma, and truth. Many applications were attempted, yet the need to develop discernment remained. Idealist and materialist modes of discernment were applied in these attempts, and the human family has already reckoned their results.

The expectation of justice, even today, remains in the human being most of all.

The present account seeks to understand and express existence as coexistence. On this basis, the development progression in compositions becomes clear. The atom is at the root of every composition, and both development progression and development within atoms become intelligible.

Development in an atom means its becoming constitutionally complete. Human beings naturally desire the existent state and grandeur of a result, together with its continuity. We have already understood the decrease and increase of particles in atoms as result. The expectation that a result be imperishable and continuous occurs only in human beings, as imagination, sense, semblance, and conviction; many attempts to realise it are therefore natural. The coexistence-oriented method shows many compositions, states, and circumstances within the development progression, with the atom functioning at their root. An atom engaged in result is constituted into the condition of constitutional accretion through the natural method of result.

Within the result-progression, atoms can be understood as hungry or undigested. Undigested atoms continually attempt to expel particles from their constitution and are therefore endowed with radiative grandeur. Atoms are always active, and their activity spontaneously produces sound, heat, and electricity. Because they remain saturated in the omnipresent reality, they retain energy-fullness and forcefulness; this forcefulness is reckoned as magnetic force. A radiative atom expresses its undigested condition through the continuing attempt to expel particles. Heat converges internally toward its nucleus, and electricity is also present. Radiativeness becomes manifest through these two processes.

Hungry atoms retain the possibility of absorbing further particles, which is why they are called “hungry.” The distinction between undigested and hungry atoms is understood in relation to the satisfied (*tript*) atom, as studied by the human being. A constitutionally satisfied atom attains the jeevan status. In a constitutionally complete atom, strength and power are consequently inexhaustible: however much they are expressed or expended, they do not diminish. Hope, thought, desire, and evidence remain keen however much they are expressed. Every human being can recognise this inexhaustibility within through examination.

The human being alone can study both itself and the whole of existence. This grandeur establishes the human being in the knowledge order. Every man and woman has equal grandeur in that order; this is the formula of mutual equality, and forgetting it is a sign of delusion.

It is thus well established that jeevan is a constitutionally complete atom, functions as a conscious activity-process, and becomes evident through the human body in human tradition. Maintaining this grandeur requires studying, understanding, and evidencing the conditions in which human beings are established or disestablished. The destination of development in the atom is therefore the constitutionally complete status.

The atom is therefore present at the root of physical, chemical, and jeevan action. Jeevan is a constitutionally complete atom, while an atom participating in physical and chemical action is constitution-oriented. Constitution-orientation entails weight bondage and molecular bondage, whereas the jeevan atom remains free of both. The hope, thought, desire, resolve, and evidence inherent in a human being cannot be weighed or enumerated on a physical scale, which is a means of recognising weight. A physical atom passes through development progression and irreversibly transitions into the constitutionally complete status. In its constitution-oriented status an atom is inert (*jad*); in its constitutionally complete status it is conscious. Development cannot be studied without its progression. Through human tradition, the conscious atom — jeevan — studies and evidences development, the developed status, awakening progression, and awakening. The destiny method thereby forms an orderliness in which awakening is evidenced and human tradition becomes grand. This method is the process, result, and continuity of existence's grandeur as coexistence.

Development in the atom is the constitution-complete status, embodied in the constitutionally complete atom. The human being studies what "is." Study means recognising in existence the objects indicated by words, through remembrance of their meanings in the light of realisation. Awakening is the remembrance of words together with the clarity, in existence, of the objects their meanings indicate. Clarity means realisation within oneself and its evidence in action and behaviour.

Development in the atom means that the atom attains the constitution-complete status, and that the constitutionally complete atom awakens; this is destiny. It becomes evident only within human tradition, for which a body-composition capable of expressing it has already formed. Human beings have applied the body in various ways to evidence this awakening. Yet tradition did not explain the constitutionally complete atom as the intent of atomic development, so the jeevan status could not be studied. That status can be studied only in the light of the awakening that occurs in jeevan; it is therefore natural to discuss it here.

So long as the constitutionally complete atom, through delusion, takes the body to be jeevan, it cannot understand development in the atom. Within the physical and chemical development progression, jeevan and jeevan-awakening become fully developed in the atom and are evidenced through the human body; awakening thereby becomes evident in human tradition. To evidence awakening is to live justly, with resolution, actuality, reality, and truth. To be evidenced is to be present in tradition. When the five faculties described above are naturally evidenced from generation to generation, the tradition is awakened.

Human grandeur is seen in the universalisation, through education, study, and practice, of research and investigation shown to be useful, well-utilised, and fit for application.

By the above method, however much application has so far occurred in giving form to the imaginary, all of that has been universalised. And however much application has occurred for mental well-being (*manah-svasthata*), it has not been universalised. Whereas the very definition of the human being is: the one who gives form to the imaginary, the one who presents the evidence of mental well-being (the idealist certainly exists).

Development-completeness in the atom is an irreversible-transition event: the atom does not return to its previous state. Freedom from result means freedom from the decrease or increase of particles within the atom.

By the coexistence-oriented method, the human being is grand as the combined form of body and jeevan. Jeevan-awakening is the evidence of mental well-being. It is accomplished within jeevan by the realisation-based method: buddhi receives enlightenment of realisations; chitta contemplates them according to justice, dharma, and truth; vritti weighs them through reflection; and mind (*mann*) tastes their values. Values can be tasted in work and behaviour only when relationships are accepted and recognised; only then are those values carried out.

Relationships bring values; values bring the dedication and surrender of objects; and this dedication brings usefulness, well-utilisation, and fitness for application. This is the grandeur and intent of development in the atom and of awakening. Only the human being is capable of presenting its evidence.

Awakening's entire form is nothing but knowing, believing, recognising, and carrying out. The material order, the biological order, and the animal order — recognising and carrying out all of these, these units evidence their own conduct in the form of participation in orderliness-with-inherence (*tva*) and in the overall orderliness. Whereas in the human being, along with recognising and carrying out, knowing and believing have remained a necessary process as well. This is evidenced properly only within the human family (*kul*). Knowing and believing, together, attest to the fact of being in the human knowledge order.

In its root form, the atom alone is the root substance of all activity. In the atom, as the outcome of development progression and development, physical, chemical, and jeevan activity occurs. As the constitution-forming atom, the world's grandeur is seen displayed all the way from the material order and the biological order up to the rich brain composition.

The first stage of development in the atom is constitutional completeness, through which jeevan is present as the imperishable activity of a conscious unit.

The jeevan atom's becoming awakened (activity-completeness) is the second stage of development in the atom, and evidencing this awakening within human tradition (conduct-completeness) is the final stage.

In this way, development and awakening in the atom are completed in these three stages — constitutional completeness, activity-completeness, conduct-completeness. This is the meaning of development in the atom.

3.4 The Nature of Mental Well-Being (मनःस्वस्थता का स्वरूप)

The study of physical, chemical, and jeevan activities requires a complete study of the human being. Tireless endeavour has been devoted to this issue. Any study of the human context that failed to recognise human-ness (*manavatva*) also left physical and chemical activity incompletely understood. Conversely, the study of physical and chemical activity alone could not complete the understanding of the human being. Thus, however much human beings may know of physical and chemical activity, that knowledge alone does not provide the thread and

explanation of the human being. This is why people in every country trust physical activity but have not yet come to trust human activity.

Consequently, no determination has yet been reached regarding human-ness, human conduct, mentality, or nature. Governing, educational, religious-cultural, technological, and commercial institutions all acknowledge this indirectly in various ways. This gap creates the need to understand development and awakening.

This point has already been made clear: that it is the atom alone that participates in physical, chemical, and jeevan activity. It has already been made clear that at the root of jeevan activity is the presence of the constitutionally complete atom. Whether it be physical activity, chemical activity, or jeevan activity — it is on the basis of the conduct of each of these three modes that we are able to determine their recognition, the recognition of their diversity, and the recognition of their unity. We determine the recognition of iron on the basis of iron's forms of conduct. In the same way, we recognise soil, stone, metal, donkey, horse, cat, dog, ant, and elephant, each on the basis of their own respective forms of conduct, and, along with this, we are also able to determine what conduct and behaviour humans are to have toward them.

It is clear that, in existence, the human being is the combined form of jeevan activity and physical-chemical activity (the body). The atom, in its constitutionally complete condition, carries out jeevan activity. It is jeevan alone that expresses, communicates, and manifests hope, thought, desire, resolve (resoluteness, *rtambharā*), and evidence (realisation). The testing of this has to be carried out by every human being, both within himself and within every other human being. For this reason the human being is an object worthy of study in the human being, by the human being, for the human being.

Mental well-being may be called happiness; it is the realisation and evidence of resolution. In the tradition of behaviour, mental well-being is evidenced as resolution. The human goal is recognised as resolution, prosperity, fearlessness, and coexistence, and every man and woman can realise it. Resolution in realisation is happiness, and happiness is evidenced as resolution in behaviour. Resolution is thereby established as the expression, communication, and manifestation of jeevan activity, mental well-being, and jeevan awakening.

Mental well-being is a most necessary issue in, from, and for human tradition. Only with mental well-being does the human goal become evident. In the process of the human goal becoming meaningful, the human being becomes ordered within himself, and participates in orderliness.

Human orderliness is not confined to chemical-physical activity because jeevan activity is also present. Every human being is testimony to this activity. Jeevan activity occurs in animals as well, but there it remains confined to hereditary tendencies and actions in accordance with the jeevan-body, and therefore to sensation. Human beings express both cognisance — knowing and believing — and sensitivity — recognising and carrying out. In the animal order only sensitivity becomes evident; in human tradition both cognisance and sensitivity do, and an awakened human being regulates sensation through cognisance. This regulation makes sensation balanced and purposeful and is the fundamental distinctiveness of the awakened, or natural, human being. Purpose is therefore evidence of cognisance.

The definition of the human being is meaningful in the sense of giving concrete form to ideas (*manakar*) and evidencing mental well-being. This is accepted in, from, and for every human being. The human being does indeed want to have a healthy mind (*manas*), and does keep on giving concrete form to ideas. This can be tested in every country and time. In this way it is self-evident that the human being, as the combined manifestation of chemical-physical and jeevan activity, is distinct from other kinds of nature — such as animal nature, plant nature, and mineral nature.

According to coexistentialist thought, according to knowledge, wisdom, and science, it is necessary for all humankind to adopt education-and-culture in the sense of the human goal. In this, it is necessary that humane conduct remain clear in the sense of the human goal, because it is only on the basis of conduct that the fulfilment of the goal of each of these orders becomes intelligible. For instance, in the material order, on the basis of the outcome for the whole substance, one gets to see conduct acting toward the goal in the form of its existent state (*yatha-sthiti*). In the same way, in the biological order and the animal order too, all the units at work are seen acting for the sake of the goal of each of those orders — for example, the biological order is seen making the journey, in the sense of existence together with growth (*pushti*), from seed to tree and from tree to seed. In this

way the entire animal order is seen acting, together with existence and growth, in the hope of living, by the hereditary method. Having seen such entirely clear conditions, it also remained necessary that human conduct be in the sense of evidencing happiness together with existence, growth, and hope — and it is for this very reason that the evidencing of mental well-being remained natural.

Human conduct combines value, character, and ethics. Values are evaluated on the basis of fundamental distinctiveness. For human beings, accepting relationships, carrying them out, and maintaining their continuity constitutes such a distinctiveness. Recognising relationships, carrying out and evaluating their values, and attaining mutual satisfaction together express value and fundamental distinctiveness. Character, the second aspect of conduct, consists in fidelity to one's own wealth, wife, or husband, and in kindness in work and behaviour; together these establish universal human character. Ethics, the third aspect, comprises moral policy and the state's economic policy. Every awakened man and woman evidences ethics by protecting and rightly using the wealth of body, mind, and money. The methods of protection are called statecraft, those of right-use moral policy, and production beyond the family's needs economic policy.

By the coexistentialist method, every human being can participate with human-ness in orderliness and the overall orderliness. This requires accepting through study that the self combines chemical, physical, and jeevan activity, and keeping in view the grandeur and necessity of jeevan activity within human tradition. Only then is the human being ready for research. The natural method of awakening directs this readiness toward universal wellbeing: all humankind expresses resolution, every family becomes resolved and happy through understanding, and prosperity, fearlessness, and coexistence are brought to bear. This is evidence of universal wellbeing, because resolution and prosperity enable human beings to realise happiness and peace. Contentment and joy, together with resolution, prosperity, fearlessness, and coexistence, are meaningful in themselves. When the human goal becomes meaningful, the jeevan goal — happiness, peace, contentment, and joy — also becomes meaningful. The jeevan

goal and the human goal become universally available through study and teaching. Human tradition then provides the thread and explanation for recognising oneself and the whole of humankind: as understanding it is the thread, and as evidence it is the explanation. The natural method of destiny comprises development progression, development, awakening progression, and the tradition of natural evidence for awakening. It is also expressed through the combination of physical-chemical composition, the body, and jeevan activity.

The human goal is to evidence resolution, prosperity, fearlessness, and coexistence naturally. On that basis, the jeevan goal is mental well-being, evidenced as meaningful happiness, peace, contentment, and joy. Human education and *sanskar* have always been necessary for this purpose, and their success is the good fortune of the human family.

The Meaningful Evidence of the Human Family and of Chemical-Physical Activity

Within existence as coexistence, the whole subject matter of education consists of chemical, physical, and jeevan activity. The activity, behaviour, thought, and understanding of human tradition are indivisible within these. Every human being must study in order to understand. Understanding is evidenced within oneself as knowing, believing, recognising, and fulfilling; study is meaningful in precisely this sense.

All units in existence are discernible as chemical, physical, or jeevan activity. From the constitution-forming atom through molecules and molecular bodies to biological cells, the plant order, and the animal order, each is intelligible through its own determinate conduct while remaining within its orderliness. The earth is the greatest such evidence: it functions as an orderliness, and upon it physico-chemical and jeevan activities are manifest as the material, biological, animal, and knowledge orders. What greater testimony could there be? On the basis of the determinate activities of the material, biological, and animal orders, the human being can trust in his own place within orderliness.

Through the self-motivated method, the human being can understand the thread and explanation for living within orderliness by the natural method of existence-as-coexistence.

The coexistentialist method makes it possible to recognise all humankind as one undivided society (*akhand samaj*). Complete understanding of this society's mentality as knowledge, science, and wisdom keeps the weave of universal orderliness clear. Human beings become meaningful within orderliness only in the context of such universal wellbeing. Universal orderliness is therefore the human family's ultimate grandeur, thread, and explanation. With human awareness, participation in undivided society and universal orderliness becomes self-motivated, because by the coexistentialist method the human being recognises himself.

In the conduct of humankind, dharma predominates; in animal species, essential nature predominates; in plants, property predominates; in material things, form predominates. It has already become necessary that human dharma, in itself, evidence resolution on the basis of happiness. All-round, resolution-complete education-and-culture is itself the tradition and the source for this. This is awakened tradition.

3.5 Coexistence Is Stable; Development and Awakening Are Certain

Existence-as-coexistence is stable, and within coexistence development and awakening are certain. Human beings on earth have reached a condition in which this fact can be studied. The awakened human being alone is the seer, doer, and enjoyer of universal wellbeing, and the bearer and carrier of the knowledge, science, and wisdom rooted in education-and-culture. Through coexistentialist philosophy, knowledge, science, and wisdom, every human being can evidence himself within orderliness and participate in the overall orderliness as universal wellbeing unfolds. This is the reach and manifest form of the programme of universal wellbeing. Study is the sole source of universal knowledge, science, and wisdom. Complete knowledge comprises knowledge of the holistic view of existence-as-coexistence, knowledge of jeevan as conscious nature, knowledge of activity and behaviour as humane conduct, and knowledge of participation in the overall orderliness. Existence-as-coexistence is studied in four orders and four categories (*pad*). At its root, within the omnipresent reality, every single substance

remains submerged, saturated, and enclosed within the whole. This is the ever-present nature of coexistence. The whole neither diminishes nor increases, nor expands nor contracts; in every circumstance, its being and abiding continue as development and awakening become manifest. Within the mutuality of units, every unit at a definite good distance has an arrangement through which natural-state motion is evidenced. It has become intelligible that determinate conduct is fulfilled as the outcome of atomic constitution only when every atomic particle is able to recognise other atomic particles. This determinate conduct is called natural-state motion. Thus, in natural-state motion, every unit — and the totality of units — can be seen and understood as participating in orderliness with inherence and in the overall orderliness. Study of oneself discloses the same state. In this sense, development and awakening are certain.

With awakening, human beings become inclined to participate, with humaneness, in orderliness and in the overall orderliness only through natural-state motion — that is, only after natural-state motion has been attained. Such motion arises only after awakening. Awakening is evidenced when a human being becomes endowed with understanding, honesty, and responsibility and thereby manifests, through participation, one's own grandeur and existent state. We also understand that only the human being is capable of understanding. Only after understanding stability and certainty can a person act honestly and responsibly in relation to them and thereby evidence participation. Understanding is therefore necessary for the human being, and the aspiration for understanding is present in all humankind.

3.6 The Stability and Certainty of Realisation and Awakening

Certainty and stability have indeed remained formed in all humankind in the form of an abiding aspiration (*chira-akanksha*). Existence-as-coexistence is the basis of knowledge and acceptance. This is a fact that becomes known in all humankind through survey. This becomes clear also from examining oneself. All of us have continued to accept stability and certainty alone, and not instability and uncertainty. It is natural for certainty to occur only on the natural basis of stability. The certainty natural to development and awakening is evidenced, in all humankind, in the form of jeevan activity. It is natural for all humankind to study the five activities of jeevan in the form of state, and five activities in the form of motion. In carrying out this study

too, the human being alone engages in study, evidences what is studied, and lives in evidenced form. The human being is therefore the evidence of awakening. In motion, jeevan activity occurs as selection, analysis, desire, resoluteness, and evidence; together these constitute projection. The five activities of state are tasting, comparison, contemplation, enlightenment, and realisation. Through them, human tradition evidences realisation. The five activities of state are expressed as strength, and the five activities of motion as power.

Selection by awakened jeevan in relation to relationships, their fulfilment, and their purposes is hope — the hope of living happily — and is the first power of jeevan. Second, analysis according to that hope is thought. Third, the continued formation of images according to the analysis is desire. Fourth, putting the justice, dharma, and truth recognised by awakened jeevan into purpose and practice is resoluteness (*rtambharā*). Fifth, evidence arising from realisation is designated authenticity. These are the five powers; the five strengths are authenticated in the same way —

1. In awakened jeevan, the activity that is realisation and its continuity is *atma*.
2. The activity that gives right enlightenment of realisation as it actually is — that is, that fully accepts it — is *buddhi*.
3. The activity that maintains the continuity of accepting justice, dharma, and truth in accordance with realisation, namely contemplation, is *chitta*.
4. The activity that compares, by the realisation-based method, the justice, dharma, and truth that have been directly recognised, is *vritti*.
5. The activity that, in accordance with comparison, expects, or tastes, the entirety of value, character, and ethics, is *mun* (mind).

In this way, the clarification of the five strengths and the five powers is given in the form of the activity that occurs in jeevan.

In the awakened human being, evidence, or the entirety of evidence, within existence-as-coexistence, is nothing but the light of realisation. In the light of realisation, no substance other than evidence remains contained at all. For this reason evidences are also indicated by the names supreme, sacred, and complete. In the second stage, the supreme acceptance of the evidences of realisation is in resolves; the forming of images of resolve is in desires; and of such forming of images —

of analysis — is in thoughts. It is intelligible that the selection activity of such thoughts, by the tasting-based method, is accomplished in hopes. By the realisation-based method, certainty becomes clear across all ten activities.

In the discipline of the accomplishment of the knowledge of jeevan, this is a matter fit for study. It is meaningful that the activities of state be realisation-directed and be expressed by the realisation-based method, and be evidenced by the realisation-based method. There is no third meaningful process or method in existence, in, from, or for human tradition. By the natural method of the human being, this alone is found, on the basis of necessity, to be the ultimate (*param*). The human goal's becoming meaningful is itself what is recognised, and understood, as the ultimate necessity. As a result, the human being is also to be seen becoming earnestly active (*sachesht*).

That the human goal is resolution, prosperity, fearlessness, and coexistence — this is evidenced only by the realisation-based method. Realisation is the evidence and the activity of glory natural to jeevan. It is only on this basis that it is fitting for the tradition of evidence to be fulfilled within the human family. In this same sequence, the good fortune of evidencing certainty for us becomes clear. This is fitting for every man and woman.

Realisation is the ultimate expression, communication, and manifestation of awakening and jeevan: nothing exceeds it, and jeevan remains incomplete with anything less. Satisfaction (*tripti*) in jeevan arises through realisation and is recognised in human tradition as happiness, peace, and contentment on the basis of resolution, prosperity, and fearlessness. In coexistence, realisation is the ultimate, and its outcome is joy. The human goal is evaluated within orderliness through the justice-and-security system. Justice and security enable the human being to remain trusting and assured in every state and motion, clearing the way for jeevan's entire natural grandeur to be evidenced in human tradition. This is awakened tradition. Jeevan-satisfaction is evidenced through participation in undivided society and universal orderliness, where resolution, prosperity, fearlessness, and coexistence become evident. This is the evidence of awakening, the ultimate grandeur of human tradition, and the highest attainment of orderliness as purpose. Stability and certainty are clear in these attainments.

As human tradition awakens, stability is evidenced and made clear through the inherent method of existence; certainty is evidenced and made clear through humane conduct. Human beings have carried this expectation from generation to generation. The capacity to evidence human development and awakening is human elevation, grandeur, and dominion. Dominion is itself defined as grandeur. Elevation means reaching, or progressing toward, the height of innateness (*maulikata*). Grandeur is expressed as family orderliness and world-family orderliness, and participation in such orderliness is the human being's good fortune. In this progression, study made available through education and *sanskar* is the worldly grandeur of orderliness. Grandeur is further expressed as dominion and self-dominion (*swarajya*), both grounded in human grandeur. It reaches every human being only through understanding and can be universalised through education. Such orderliness is free from treachery, rebellion, exploitation, and war, and is instead endowed with resolution, prosperity, fearlessness, and coexistence. This is universal orderliness.

A tradition that evidences awakening and comprehensive resolution, free from war and conflict, is the thread and explanation of orderliness. Every man and woman has the self-motivated propensity to evidence awakening through understanding. On this basis the human being can evidence trust in the present. This is the link: coexistence can be evidenced only on the basis of trust in the present.

Within awakened human tradition, stability is evidenced through existence as coexistence, and certainty through humane conduct.

3.7 Heat and the Earth's Balance (ऊष्मा और धरती का संतुलन)

We see nature, other than human, as the greenery spread out upon this earth, replete with mineral wealth, and as the world of living beings. This earth is endowed with mountains, forests, rivers, streams, and living animals. Prosperity means that all these are indeed present on this earth. The earth has minerals contained within itself in solid and rarefied form, and the chemical world spread out upon it is seen to exist in solid, liquid, and rarefied forms. Many things in solid form are indeed to be seen. For example, the bones formed in the body

do remain in solid form. Such things, before becoming solid, do remain in liquid form. Chemical liquid, being combined through conjunction with heat by the disintegration method, remains present in rarefied form. This means that by the heat method a thing begins to expand. If heat is made to enter into some solid thing, then that thing begins to spread into more space than its definite volume-form. It goes on expanding until it becomes liquid, becomes rarefied.

We recognise heat by this method: the effect that occurs when a thing burns or is burnt — to this we are giving the name heat. We are able to recognise it in another way as well: a thing that has become more excited is always heated up. That is, its temperature increases. It is the human who recognises temperature. The rest of nature is affected by temperature. Setting the human apart, temperature does not get recognised by any measuring standard. To deploy temperature in applications and to assess the consequent outcomes is accomplished only by the human — that is, only the human carries it out.

Recognising occurs in both insentient and sentient (*jad–chaitanya*) nature; in recognising and fulfilling, insentient nature stands evidenced. Whereas knowing and accepting occur only in sentient nature, in the human. The human, while being in the combined form of the insentient and the sentient, is endowed with the capacity for knowing-accepting. On the basic point, recognising too is an activity. One substance projects temperature for another; whatever temperature they express out of themselves, the molecules and atoms around them accept that temperature. This is what we are calling recognising. As a result, transformations come about. For example, whatever heat is deployed for melting iron, the iron accepts it; the molecule and atom of iron accept it. As a result it melts. We humans explain this activity thus: it recognises, it fulfils — only then does it melt. The human alone is such a unit that changes heated iron into various shapes; this is what we regard as casting into a mould. In this, the iron keeps on projecting heat until it sets again, until it becomes cold. All the substances joined with it apportion the iron's temperature to themselves. Eventually the iron becomes cold.

In the endeavour to stimulate temperature — that is, in the activity of manifesting and increasing temperature — there is always the conjunction of one that burns and one that makes burn. For example, coal is what burns; the air keeps making it burn. Going to its root, for burning coal in the initial stage some burning thing or other is there in the role of the igniter — such as burning fire. Proceeding by these methods,

the human is seen carrying out the activity of stimulating temperature from coal, wood, natural gas, petroleum gas, or by the radiative process. Along with this, the identification of explosive substances, their combination, and heat-stimulation by the pressure method is also being seen.

Deploying such heat, humans do accomplish necessary tasks — such as heating water, cooking food, warming a room, drying medicines, and so on. In the same way, the human does carry out numerous activities by the conjunction of heat, under control. The human tradition has become habituated to this. Wherever temperature may be, it needs to be more than the temperature of that environment — only then is it temperature. Put another way, wherever there is temperature, there has to be less temperature around it; only then is the greater temperature projected toward the lesser temperature. Just as, wherever we light a fire, greater temperature comes about there. The activity of being projected toward lower temperature is seen thus: where temperature remains manifest, it spreads through the molecules and atoms around it becoming heated. This means that heated molecules, spreading temperature into their sphere of influence, into the environment, make heated those molecules which remain lower than its temperature. The molecules-atoms of the environment accept this and carry this sequence forward. In this way temperature, being projected, goes on diminishing, and eventually they arrive at normal temperature. Normal temperature means being in natural-state motion (*svabhav gati*) (natural-state motion means the existent-states that there are in development progression, development, awakening progression, and awakening — that is, orderliness with inherence (*tva*); participation in the overall orderliness itself is natural-state motion).

This can be applied as follows: light a candle and place it in one corner of any room, or light a kerosene lamp, or a heater, light a stove, or light bulbs giving as much light as possible; the amount of heat we feel on touching it will be felt as less at some distance from it, still less farther away, and least of all in the opposite corner — every student can observe and test this. If the same application is carried out with it placed in the middle of the room, it becomes known that heat is projected equally in all directions.

In the same way, by the above application method we can also accept that the sun's heat is being projected equally in all directions. The heat projected from the sun's orb touches the earth in its facing-ness toward the sun. Along with this it is also understood that, as the earth rotates, the part that remains facing the sun becomes heated. For this very reason sunrise and sunset occur. Even at the time of setting, a minimum of heat remains touching the earth. In the middle between these two, midway, the maximum heat remains touching it. Every person can test and observe this.

The earth's rotational motion makes clear the arrangement by which it faces toward and away from the sun. The vibrational motion accompanying this rotational dance is expressed as its circumambulatory, or orbital, motion around the sun. At the root of this motion is the tendency toward orderliness with inherence (*tva*): orderliness is evidenced while units remain at mutually good distances, and definite fulfilment is present in every reciprocity. The earth accordingly circles in coordination with all the planets and orbs participating in this solar system, alternately facing toward and away from the sun while maintaining a definite good distance from it. Its orbital path is not perfectly circular but elliptic. The principal intent of this tendency is the earth's self-motivated seasonal change and, ultimately, the manifestation upon it of development progression, development, awakening progression, and awakening. How are human beings to understand this intent?

The point becomes intelligible in this way: all four orders are manifest on the earth. What was not present does not arise. The root tendency of all four orders was therefore contained in the material order itself; otherwise neither compound activity nor greenery could have arisen, yet compounds have formed and greenery has spread across the earth. Living animals, from tiny insects and worms to numerous beasts and birds, have emerged and established their traditions, as has the tradition of the human body. The human being has no grounds for denying any of this. The human role is to study what is, and all four orders are objects of that study. Study discloses that, through the orderliness and influence of the seasonal cycle, through complementarity, and through the orderliness of physical activity, the orderliness of chemical activity

has emerged upon this earth. In this very sequence, the formations of all four orders have become fully clear. All minerals too, in solid form, are presented as the molecular formation of their own respective species or as mixed formations. On the basis of the various species of these, the compound happening, chemical resonance (*urmi*), and grandeur — that is, dance — has taken place. On the basis of chemical substance, the entire biological cell (*prankosha*), the structures composed of biological cells, plant species from small to large, animal-order species, and the formation of the human body species stand evidenced on this earth itself. From this it became clear that, together with energy-fullness, forcefulness, and activeness, the tendencies of development progression and development remain contained therein.

Jeevan has already been identified as being in the developed, constitutionally complete stage. Within this constitutionally complete atom is the arrangement for motion according to hope (*asha*). Moving self-motivatedly according to hope, jeevan operates the body of an animal-order or knowledge-order being through the force of hope. It is also reasonable that such jeevans may travel from one earth to another. We therefore understand that development progression is evidenced on every earth through physico-chemical formations and their traditions. Each earth, maintaining a definite distance from an enriched earth and participating in orderliness, continues to evidence development progression, development, awakening progression, and awakening. The seer of all this is the awakened human, not the deluded human. Many earths are active in one condition or another, and all undeveloped earths are oriented toward evidencing development. Even earths upon which development progression has not yet manifested retain a tendency to establish it. Human tradition likewise holds that the sun-orb, now in the ultimate condition of decline, will in time enter development progression. All these conditions favour development and awakening. Whatever an earth's present condition, it contains the root seed for evidencing development progression and development: excitation tends toward normal motion and natural-state motion; natural-state motion toward development progression; development progression toward development; development toward awakening progression; awakening progression toward awakening; and awakening toward its own continuity. By this method we can trust that the entire

coexistence is active with balance precisely in the sense of displaying development and awakening according to the existent-state. In this very sequence, one sees the presence in several planet-orbs of maximum heat such as there is in the sun, and the absorption of heat into all those planet-orbs facing them in which less heat remains. In this sequence, how much effort (*śram*) this earth has performed within itself — this becomes evident to every awakened human.

On the upper surface of this earth are found forests, oceans, and, in a small part, desert. Whatever kind of forest it may be, most of the trees and plants, creepers and shrubs of the forest, making the substance known by the name *apana air* (*apan vayu* — carbon dioxide) their food-material, or making it their digestion-material, provide *pranavayu* — that is, oxygen. Whereas coal, and the oil-petroleum derived from mineral coal — in all the machines in which these are used as fuel, or where they are used by the technological method in the operation of machinery — the life-fatal air (carbon monoxide) found in the discharged fuel-residues of all these is being regarded as extremely fatal for the environment. From this it becomes known that, at the root of such mineral coal, the great forests which, having been buried in the earth, are today manifest in the form of coal — those forests, before being buried, had digested that very substance within themselves; making this their food-material, they must have become sky-kissing trees. It is natural that the conception of such sky-kissing-ness be made on the basis of the thickness of the mineral coal formed in the earth. At present, in some places, a coal seam of 150 to 180 metres' thickness lies deposited. From this an estimate can be made of how enormous the trees must have been. For one metre of coal to form, at least ten metres of tree length is required; everyone can understand its density by the mathematical method. Thus, what a forest of great trees there must have been to make such immeasurable coal can be worked out only by the mathematical method. It is very difficult even to fit into ordinary conception; what can be brought into conception is just this — that there must have been sky-kissing dense forests. Such forests, buried inside the ground, must have become coal over hundreds of thousands of years; that same forest must have been digesting the life-fatal air (carbon monoxide); now that same thing produces carbon monoxide. At present, plants digest carbon dioxide and produce oxygen. All this has become known to the knowledgeable and the scientists. We are mentioning this matter here for this reason: what is its purpose for this earth?

We have understood the point that coal, carbon, absorbs heat. It takes into itself as much of the environmental heat as possible. This can be applied as follows: coat one uniform patch of ground with coal; coat another similar patch with white. At the time of harsh sunshine, where the coal is coated, placing one's foot there feels hot; where the white is coated, it feels less hot. The conditions in between these two can also be seen in other places. From this it becomes known that coal digests more and more heat into itself. It distributes it slowly. From this evidence we come to understand that the cosmic heat reaching this earth — of which the greatest is the sun's heat — needed to be digested on this earth. Because it was only after the earth maintained its heat balance that greenery remained secure on the surface of the earth. Only after greenery remained secure did the emergence of worms, insects, and animals occur, and only after that the emergence of the human — this we humans understand as the sequential formation-grandeur. At the root of this grandeur, the earth's maintaining heat balance within itself has been a principal attainment. In this, the human made no contribution. It is the oil contained in this very coal that, maturing in the earth along with mineral substances, has become available in the form of mineral oil. Its preservation too remained ensured inside the earth, with the protective shield of a suitable environment. Keeping it secure means precisely maintaining an environment such that *pranavayu*, i.e. oxygen, is not allowed to reach the oil.

In this way we arrive at the fact that, in step with the earth's vibrational motion, there is vibration and pulsation in the whole of the minerals; more pulsation than that in chemical substances; more pulsation than that in *pranavayu*; and as a result, formations stand manifest on this earth. All these are in the sense of manifesting such balanced formations; prior to this is the entire activity accomplished in the background; hence all these have been carried out lawfully indeed — the orders stand manifest with control and balance. We humans need to understand this well, and there is need to set ourselves in order by the method of preservation and enrichment with diligent study. At the root of the human's being in order is the clarity of a harmonious, music-like working of knowledge, science, and wisdom. This very working, being deployed in language and in work-behaviour, propounds the purposes. The human's purpose is precisely to evidence resolution, prosperity, fearlessness, coexistence.

In this sequence, humans by their own logic think thus: when the sun becomes developed (natural-state motion), from where will heat be obtained for the earth; how will these greeneries remain on this earth; all these greeneries are due to sunlight. The thread of the resolution of this is found in us humans ourselves, at the very first step. A definite heat (temperature) arrangement of the human body is in place. According to our measuring standard we put it at 98°–99° Fahrenheit. The name of the measuring standard is taken to be the thermometer. This fact has been seen in the living, breathing human on the earth: where the temperature is below 0° Fahrenheit, humans live there too, and the temperature of the human body of the humans there is also measured as that same normal temperature. On this earth where heat of more than 120° Fahrenheit holds sway, there too the same normal temperature of the human body is being measured — only then is the human said to be healthy. If the temperature changes according to the environment, one is called sick, or is said to have died. On the basis of this evidence, the health of the earth can also be considered. The cosmic rays and heat in the earth's environment that, being projected, touch the earth — so that the earth's temperature neither rises nor falls from this, the earth maintains in balance, from within its own self, a heat-digestion arrangement; this has been described before. This is contained in the earth in the form of the seam of coal. The human, out of his own inwisdom and out of greed, tore open the earth's belly, extracted the coal, and the earth became heat-afflicted. No scientist, nor the technological world, is prepared to accept this responsibility. Its remedy remained set aside. By this method where will we arrive; what can happen? The form of the first evil result is that, after the earth becomes heated by a certain amount, greenery, animals, and the human will not be able to remain on this earth. In the second situation, after the earth becomes heat-afflicted, in the event of the melting of all the ice stored at the north and south poles, there can be a state of submergence in water everywhere except the high mountain peaks. What the condition of the human can be in such a situation, all can imagine. The situation of the third evil result can also be this: whenever on this earth the compound activity in the form of water was accomplished, a situation must certainly have formed of one burning and one burn-causing substance joining in a spontaneous way. At that time, for keeping both the burning and the burn-causing sub-substances normal, the cosmic ray alone has been serviceable. Today's human has come to recognise such cosmic rays — alias the world of radiation and radiativity. On keeping this matter in mind, the conception described below comes to attention, even if the said event should not occur. Today, out of our own inwisdom and greed, we go on making the earth heat-afflicted;

as a result, the possibility of the earth's safety has become slight. The measures of *pranavayu* have gradually begun to decrease; the substance hostile to *pranavayu* has begun to increase — this is what we are calling pollution.

In such a situation, the cosmic ray, which has been the combiner for water to form, can, by force of combination with such pollution, become the cause of the opposite event (the cause of the disintegration of water). In such a situation what will become of the human? For this dreadful catastrophe upon the breast of the earth — all of us who are called scientists, knowledgeable or ignorant, who are called the helmsmen of the technological world — do these have any answer to it? No one is to be seen giving an answer to this matter. Because no one accepts responsibility. This is its testimony. There is difficulty in accepting responsibility, because a person becomes answerable for atonement. Therefore, endeavour toward its correction alone appears to be the sole duty. Its propriety finds acceptance with more and more people.

The fourth calamity: on the basis of the earth becoming heat-afflicted, the deflection of the earth's magnetic field of influence is also one possibility. In this earth, between the north and the south pole, by a self-motivated method, a magnetic current or magnetic field of influence has formed. This matter too has been accepted. On this very basis, direction-indicating instruments and apparatus have been made and put to use. By this method, the bondedness that pole has maintained with pole — on this very basis the unbroken work of the earth's being solid kept being carried out. By this, layer upon layer of the earth, heat-collection, digestion, and equilibration kept being accomplished. By this the earth's health — the arrangement of remaining balanced in respect of temperature — has persisted. At present the human does make the declaration of the earth being unbalanced, but does not accept his liability for it; therefore, the searching out of remedies does not come about; as a result, resolution does not come about. In this sequence, the possibility of temperature increasing further in the earth is being accepted. This warns of the following: the magnetic current bonded from pole to pole, after reaching a certain temperature, can be deflected; from this it is natural for this earth, instead of being solid in itself, to begin to scatter. After this scattering, it comes into human imagination in the form of dust. After that, where will the human remain, where will animals remain, where will greenery remain, where will water remain, where will the arrangement of water's cyclicity remain? All these inverse events are indeed in a position to wound the human psyche considerably.

The undertaking of its remedy is just this: whatever work is to be done from coal and mineral oil, its alternative will have to be identified. Stopping the use of coal and mineral oil is the sole remedy. Along with this, we have already accepted that the radiative fuel system too is fatal for the earth and for the earth's environment. Fuel by the radiation method is fatal; fuel by the coal and mineral method is also fatal. To stop their use is the human's first duty. The second duty is to obtain the alternative of a fuel arrangement for maintaining human convenience. This alternative is apparent in a natural form — converting flow force into electrical energy. From the provision of this single source, by a pollution-free system, electrical energy can become available in excess of need. Along with this, for becoming prosperous: the pressure of wind, the pressure of ocean waves, cow-dung gas, natural gas which in a natural way keeps moving from within the earth toward the sky — making full use of all such sources is in the human's interest, is in the sense of human happiness and prosperity. For those machines which run only on oil, the research into making edible and non-edible oils (obtained from plants, from trees) machine-usable by various combinations should be completed. Only then can the human also maintain the conveniences obtained from machines. Fuel prosperity can remain intact. For oil purposes, the introduction of oil-bearing trees in the forests is certainly possible; this can also happen along roads and in parks and gardens. It can also be on the boundary-ridges of farmers' fields; this is a programme to be accomplished solely on the basis of good sense in the human. In the upper surface of the earth there are vast possibilities — of creating energy sources, of creating fuel sources. Pressure sources, flow sources, solar energy sources — all these are naturally there in abundant measure. Along with these, the possibility of the multiplication of oil-bearing trees is on the earth itself. Inside the earth there is no source of this kind at all. What is there is only for keeping the earth healthy. If we test and observe rightly, the entire source of good fortune is on the surface of the earth itself. Inside the earth, no source equal or similar to the upper part is to be seen.

In this same sequence one more fact is worth remembering. Attention went toward the earth's nether (deep-ground) water source; in a mere 25–30 years the nether water source became depleted in most places. As a result, the surface water source dried up — ponds and step-wells dried up. The human set off toward ruin. Give a little attention to this issue. However vast the upper part of the earth is, with every 10

feet the vastness goes on decreasing. Every student can test and observe this. For instance, draw a round circle — this is easily made by hand, and can be made with a compass too. After that, draw circles inside, one at each halving; the circle drawn inside goes on becoming smaller. In the same way, the earth's inner surface goes on being smaller than the upper surface. We humans, out of delusion, went grappling with the hope of getting more from the nether sources than from the upper surface. From this too an unprecedented loss has already occurred. If meaningful thought is given to this issue, it becomes certain that the source of the nether water is nothing but the water flowing on the earth's upper surface. In the upper part of this earth water is spread out, is flowing; their cyclicity remains ever intact. As a result of being in direct contact with the sun's heat, the evaporation of water on the earth; this same vapour condensing and turning into cloud; the cloud so formed becoming enriched over some period; and, as an outcome of such enrichment, rain again falling drop by drop upon the earth — this cyclicity is to be seen. In this, it is ascertained that the meaningful thing is just this: that water on the earth be detained and kept spread over more area. By this alone can the human's future become secure.

Along with this, on paying further attention it becomes known that the grandeur of the biological order, the grandeur of the animal order and of the knowledge order, their workings, and the auspicious site of work-behaviour, stand evidenced only on the upper surface of the earth. These three orders cannot flourish anywhere inside the earth. Along with this it is also seen that celestial light is reflected (imaged) only in the upper part. On the basis of the earth being opaque, it is not possible for celestial light to be permeative through the earth. It is necessary for the human alone to pay attention to all these facts. Because it is the human alone who has interfered in the inner part of the earth; its result has already turned inauspicious. Its clarification has been done. The human wants only wellbeing (*shubh*). There is need to become adept in the formula and explanation of wellbeing. On the basis of such a formula and explanation of wellbeing, or the formula and explanation of universal wellbeing, one lives evidencing the coexistence method — that is, law, control, balance, justice, dharma, and, with truth, resolution, prosperity, fearlessness, coexistence. Universality is the formula and explanation of wellbeing. We have understood this matter well. We have explained it before: undividedness is the formula, universality is the explanation; its bearer-carrier is the human alone. This is the evidence of awakening, the grandeur of good fortune. This is also the human's desire; therefore, all improper, unnecessary, ruinous tendencies, work-behaviours, and configurations that have occurred through the human out of delusion — to correct these with awakening is itself the human's honour, and, together with it, good fortune.

3.8 State–Motion (स्थिति-गति)

The human being wishes to evidence state–motion through awakening, both in oneself and in relation to the whole. The first principle is that state and motion are indivisible: to be is to remain in motion. An atom and a planetary globe remain in motion on the basis of being. The entire material world maintains motion through formation and decomposition; plants through growth (*pushti*); and the animal order through its activity. Human beings evidence motion on the basis of awakening. Thus every eternally established unit in existence-as-coexistence is present as state–motion. State is expressed as strength and motion as power, and strength and power are indivisible.

This indivisibility of state–motion is also evident in human jeevan activities. Realisation (*anubhav*) is state, and evidence is motion. In buddhi, the enlightenment (*bodh*) of reality, actuality, and truth is state, while the resolve (*sankalp*) to express it is motion. Enlightenment manifests realisation, and evidence communicates it so that others may realise it. In chitta, contemplation as the direct recognition (*sakshatkar*) of justice, dharma, and truth is state, while picturing it through visualisation is motion. In vritti, deliberation (*tulan*) on justice, dharma, and truth is the innate state; analysing and communicating that deliberation is thought-motion. Analysis accepts the essence as value. Tasting that value is the state of mind (*mun*), while selecting the manner and method of making it meaningful is motion. Human beings are therefore present in state–motion in every respect. Once endowed with understanding, they naturally evidence it. Until then, acquiring the knowledge, wisdom, and science needed for evidence is the meaning of education and instruction; the coexistential education sequence is appropriate for this purpose.

To understand coexistential knowledge, wisdom, and science is to attain understanding. The idealist and materialist modes of living and thought did not yield a method of universal wellbeing. Its source is coexistential knowledge, science as thought, and wisdom. These can be understood and communicated. Each person can live in the state–motion of understanding, help others to live, and incline them toward evidence. Understanding is disseminated when all humankind evidences this state–motion within universal and undivided-society relationships. Participation in these steps is evidence. Such realisation-based evidence is universal and can only be confirmed by living it.

The human wants to be adept in the discipline of science. In becoming adept, the hindrance in application and practice so far has come down to just these points. First, no trace of the ultimate truth could be found; second, the root measure (*mool matra*), the source of energy, and the goal could not be ascertained; third — the study of the human could not take place; fourth — the purpose of existence could not become clear. In this manner, even after applying science with such long and wide dedication, all those wishing to live clearly ended up frustrated. On this issue it was first settled that whatever claims come before science by the materialist method or by the idealist method — that is, whatever question marks arise — the attempt be made to solve them on the basis of the economic, social, and political poles. But on this basis no logically consistent and purpose-consistent work-behaviour, orderliness, or tradition according to any meaningful view could be established. Compared with this, such a desire is being found in every man and woman who desires wellbeing — in other words, who desires universal wellbeing. On the other side, the matter of becoming frustrated has become clear. Even among those who become frustrated, many people must surely be desiring universal wellbeing. If one proceeds to reason consistently by the method of desiring wellbeing, universal wellbeing alone is the pole. Now here, taking the desire for universal wellbeing as the acceptance of all humankind, or the acceptance of the majority, this treatise has been carried forward in the sequence of thinking, understanding, and presenting evidences further.

Whatever methods have so far been called science — in them, the conception and evidence for clarifying the following points have been from their own standpoint. The standpoint of science is committed to struggle. On this basis, the whole of nature other than the human is

for the human and for human use. Among humans, it is then the most powerful who is deemed fit to use it — the one who beats, plunders, murders, terrorises, and slaughters others. One may ask whether science has ever explicitly declared this. It has not done so in a formal document. Yet writings composed as personal opinion in the name of science contain claims of this kind.

The central difficulty is uncertainty and instability: science is treated as independent, while the scientist is not. Scientific writings themselves confirm this stance. Yet responsibility belongs neither to a book nor to an instrument, but to the human being. The belief arose that whatever an instrument demonstrates repeatedly is true, even if it is not the ultimate truth. The instrument thereby became the principal evidence, and human responsibility was displaced onto it. An instrument cannot reason; it merely repeats its operation. Repetition was consequently taken as the basis of trust and assurance, distancing human beings from responsibility even though they make and use the instruments.

Observation and testing show that every human favours responsibility, justice, and orderliness. At the root of all three, every human favours understanding.

One further point must be made. By definition, we humans give concrete shape to ideas (*manakar* — the mind's forms), yet prevalent education has been unable to evidence mental well-being. Mental well-being is essential to being human. In evidencing this essentiality, we have examined within ourselves and established that the human being is happy through the coexistential method. In every discipline, we become happy only by living with resolution. Living with resolution becomes meaningful through understanding, and understanding is accomplished through the complete standpoint of coexistence. As seen earlier, understanding has its eternal source in three disciplines. The study so far has shown that understanding is not evidenced by idealism, materialism, or logic alone. By the proposed coexistential

method alone, by the realisation-based method, every man and woman can evidence all-round resolution with humane conduct, in the form of understanding, honesty, responsibility, and participation. They can realise happiness for ever and ever within themselves, because being endowed with universal resolution is itself the very first rung of understanding. This is indeed present in every awakened human. For this very reason, the possibility of being happy for ever and ever also remains contained therein. On this very basis, the need to be evidenced persists. Thus, it became possible for every understanding human to be responsible and to be benevolent in, from, and for the tradition. The meaning of benevolence (*upkar*) too is clear. In the sense of awakening: to make understood what has been understood, to have done what one has done, to teach what one has learnt — all this being resolution-bringing, benevolence consequently becomes meaningful. In this manner it has become clear how the human can be benevolent. It has also become clear how all of us — those regarding themselves as understanding and those regarding themselves as ignorant — created problems. Along with this it has also become clear that the world of science, in its mentality and in its works of enlightening, in the course of arriving very far from responsibilities, tried to recognise the human as being like a machine, and in this failed utterly.

Nothing remains unclear by the coexistence method. Things can be understood, and communicating what has been understood is a self-motivated activity. The basis of the manifest and unmanifest thereby becomes clear. What a human being can evidence, communicate, and live is manifest; what was regarded as understood but could not be communicated was called unmanifest. Yet existence-as-coexistence is eternally present and manifest; nothing in it is unmanifest.

3.9 Measure

Every substance exists as a single unit and expresses actuality. In each substance, actuality is orderliness-with-inherence (*tva*). Form, property, essential nature, and dharma are mutually and indivisibly present and are expressed together with measure. Their expression, communication, and manifestation are rooted in coexistence. Every unit in coexistence is submerged, saturated, and enclosed within the omnipresent reality, which permeates it transparently. Saturation in Omnipresence energises each unit and endows it with magnetic force.

Each and every atom alone is the root measure. Such numerous atoms, in the form of molecules; numerous molecules, in the form of molecular composition; such compositions, in the form of matter and the biological order — this too has already been made clear before. In every species, atoms constituted from two particles up to many particles have made their own respective forms of conduct clear.

The atom is the root measure because a defined unit is itself an orderliness and participates in the overall orderliness. Even a unit not yet within orderliness — such as an atomic particle or a deluded human being — retains the tendency to participate in it. A particle by itself cannot evidence orderliness or express determinate necessity. It is therefore inclined to participate in an atom: it is absorbed into an existing atom or joins other particles that mutually recognise one another and function as an atom. Their resulting determinate conduct is orderliness. Atomic particles thus recognise and fulfil one another within the atom.

Just as an atomic particle does not exist in orderliness without recognising other particles, so too the human being cannot live in orderliness at all without recognising other human beings. There is one and only one thread for recognising the human being — human-ness. Human-ness is nothing but human consciousness, by which all humankind can be recognised in the form of the human being. Human-ness, in its own nature, is nothing but the nature of the definition of the human being. In the sense of mental well-being

itself, the coexistentialist method enables even science to analyse, determine, and elaborate the thread of mental well-being. This determination is necessary in relation to the human goal. Human beings must firmly recognise humane necessity, whose certainty is evidenced through resolution, prosperity, fearlessness, and coexistence. Humane conduct becomes clear only in the process of evidencing this goal. Determining humane necessity indicates knowing and believing; together they provide the thread and explanation of evidenced conduct.

It is natural that the principle of measure too, at its root, remains animated by these very meanings. Therefore, as more than one particle gathers together and functions — that is, conducts itself — the many species of atoms remain recognisable on the basis of their conduct. The human being recognises this; this becomes the grand, dignified condition of the human being's own natural fitness. At the root of this remains simply the tinge of knowing and believing. In the same way, in the compositions constituted from biological cells too, the composition of the biological cells remains determinate. The evidence of this is precisely the composition of the plants of many species — in all of these, remaining animated from seed to tree, and from tree to seed — that is, impulses from one seed to the tree, and impulses from the tree to the seed, remain contained in that very seed-tree. In these two kinds of impulse together, the necessity of the trees of that species has been made clear. In this way we human beings recognise any substance in a firm form; the basis of this remains precisely firm necessity. In the same way, the human being has become assured about the conduct of the ant up to the elephant, of the dog up to the cat, and of the cow, the tiger, the hen, the insect, and so on. Along with these, the human being has also adopted the necessary method. This necessary method appears, by way of indirect statement, to have been accomplished all the way to the world other than the human. When, in that same sequence, human beings come to the position of recognising other human beings, we then feel doubtfulness — whether we are managing to recognise them or not. For this doubtfulness, disputes remain formed in human tradition by methods relating to caste, ideology, sect, position, and money. As a result, treachery, rebellion, exploitation, and war are found effective. What is meant by being effective is that these accidents keep on occurring.

Even if the human being were to consider himself as mere measure, would the human being's necessity thereby become clear? Even on thinking of oneself as mere measure, it still seems that we human beings have not been able to determine our own necessity, and it is for this very reason that necessity has remained uncertain,

and even on the basis of necessity we have not been able to recognise the universality of orderliness, its poles. One pole of human-ness is precisely the human being's own necessity, which becomes evident in behaviour, in the work of production, as participation in orderliness with resolution.

Human necessity is entirely clear: resolution, prosperity, fearlessness, and coexistence. Its evidence is successful humane conduct in the form of value, character, and ethics; this has been tested through application. Neither the idealist nor the materialist method establishes it. The coexistential method therefore makes the human goal and humane conduct accessible to study. Their universal success throughout humankind is the glory of an awakened human tradition. Human beings continually seek within themselves to evidence value, character, and ethics. Why should this not be pursued as a human necessity? Any person can make such a resolve. The need for it is especially apparent at a certain age. Predominantly between twelve or fourteen and twenty, most people expect justice in society, orderliness aligned with everyone, and happiness for all. Attachment to one faction or another gradually stunts these expectations. People then regard only the outlook of their own sect or class as right and proper. The result is mutual treachery, rebellion, exploitation, and war.

Coexistential study makes it possible to affirm that, at some age, all human beings wish well for the greatest number — that is, they wish for universal well-being. At present, the same person who at one age wants happiness for all or most people may later become absorbed in gathering conveniences for self and family. Balancing these tendencies requires consciousness-development value education according to Madhyasth Darshan — in other words, the universalisation of coexistential education. The coexistential method must be adopted to bring all four orders to a point of balance.

Every substance in its subtle atomic form is a root measure. As compositions, substances are available to us as units of many sizes and as minerals; our future remains bound to these attainments. The results of today's conduct and work-behaviour, including conduct within disorderliness, must be undergone even if they appear only years later. We must therefore remain understanding in the present and diligent in preserving a tradition of understanding. This is the meaning of the human being's state–motion.

State-motion, in every measure, is a natural activity. It is only in the combined form of state and motion that every activity is recognised. The conduct of a substance is recognised; in motion, conduct remains as outcome in state. This is the form of the existent state. The thread and the explanation of the existent state remain contained in this very thing. For example, hardness in iron is a physical necessity. It is only in its state-motion that the evidence of this comes about. To make use of iron is precisely what is meant by its capacity for motion. It is only when the human being, bringing his own power and strength to bear, tests iron, that trust in iron comes about. In this the human being has already succeeded considerably.

Many substances have been tested and inspected, yielding certainties on which numerous technologies operate. People undertake technical education in order to participate in these technologies, and many succeed in doing so. Yet success in technology has not evidenced mental well-being. For that, recognising the human being is primary. Such recognition occurs only through living with resolution and prosperity and evidencing justice, which consists of relational value, evaluation, and mutual satisfaction.

Without oneself carrying out humane conduct, recognising humane conduct in another human being simply does not come about. This can be tested in the following way. One person carries out humane conduct, and another also does so; if, in the mutuality of these two, work-behaviour is assessed, and applied research is also assessed, then of humane conduct

evaluation occurs in their mutuality, because evaluation is possible only between persons. If one person carries out humane conduct and the other does not, the former trusts himself while the latter does not. If neither does, they may agree about some vices and partly agree or disagree about criminal thoughts and acts, but no conclusion emerges.

These situations show that an awakened human being preserves identity through conduct grounded in inner orderliness. This is the ascertainment of the existent state. The material, biological, and animal orders have already been ascertained by trustworthy methods, and human beings have relied on them to attain success, chiefly in accumulating conveniences, though these have not reached everyone. Undivided society becomes possible only when human beings maturely evidence their own necessity. Once the thread of undivided society becomes meaningful, universal orderliness can be explained; this is the meaningful and effective form of wisdom and science. The study must therefore address the human being, human-ness, humane conduct, undivided society, and the thread and explanation of universal orderliness. Every human being's purpose begins with firmness in conduct, proceeds to evidencing conduct within orderliness, and culminates in participation in universal orderliness.

At present, while recognising everyone else, the human being is most backward in the discipline of recognising the human being. This deficiency can be made up through work-behaviour filled with knowledge, wisdom, and science. This means that, in the units of the three states, participation, together with their own inherence, in orderliness and in the overall orderliness, has already become evident. It is precisely as an outcome of this that the human being has succeeded in giving concrete form to ideas. Iron's remaining unfailing in its own orderliness; soil, stone, gem, metal — all remain unfailing, each in its own conduct. On this very basis the human being has been able to enrich, together with these, the technological system relating to his social ambitions, or production. If all these were to become mutually quarrelsome, given to disagreement, opposition, and rebellion, like the human being, what would happen then? If, in the same way,

the rest of nature too were not to maintain stability and certainty in its conduct, what would happen? No human being would have the possibility of giving concrete form to ideas. It became a meaningful form for the human being that the three states, by the sequential method, each remain manifest in the form of determinate conduct according to their own existent state. But the human being, in order to be meaningful while living together with the rest of nature, has simply not managed to evidence mental well-being. Without evidencing this, it is not at all possible for the human being to be complementary with all of non-human nature. Not only this — without the human being being complementary with the human being, being complementary with the rest of nature does not come about at all.

From the coexistentialist viewpoint, the activity, process, and meaningfulness of science become assured, because, by the coexistentialist method, the purpose of science is to determine the direction for the human goal to become meaningful. Since the human goal is resolution, prosperity, fearlessness, and coexistence, it is precisely the determining of the direction, and of the methods of teaching, for this to become meaningful in all humankind that is the purpose of science and wisdom.

Science has its importance by way of this method of determining such a goal. By this method both the viewpoint and the work of wisdom and science became clear. This also makes clear the intent that, in favour of human conduct becoming determinate —

- science should become meaningful in the sense of wisdom;
- wisdom and science should become meaningful in the sense of knowledge;
- knowledge, science, and wisdom should become meaningful in the sense of coexistence;
- knowledge should be in the sense of coexistence.

This is the meaning of realisation-based coexistentialist knowledge, science, and wisdom.

Measure, in its root form, is recognised as a unit that is itself an orderliness, and that participates in orderliness. Such a unit begins in the form of the constitution of more than one particle, whose shape (result) is determinate. On the side of the determinacy of shape (result), a great many examples have already been presented. Now here it is necessary to become clear about form, property, essential nature, and dharma. Every form is clear in the forms of shape, volume, and bulk. What is meant by shape is however it remains constituted, together with however much

space it remains spread out over, and functions — that is, remains in state. As one might think about a tradition, into however much space it remains active. In the same way, further, the compositions constructed from numerous molecules, whether very large or small — the shape they remain formed in, however much space they occupy — it is on this basis that the recognition of form comes about. Of this, what shape is, how the shape is, is a matter of construction; the meaning of volume is enclosure (spread). What is meant by enclosure is remaining bounded on every side within the omnipresent reality; by another method it is also in terms of length, breadth, and height. By these methods we are able to recognise shape; every such shape, or unit, remains reflected on every side. The unit remains reflected in the units situated on every side of it, which are illumined by it. In this way the method of mutual recognition remains formed. There is no need to construct the method of recognition. By this method, every substance remains reflected upon every other substance. Every substance is luminous.

On thinking by the above method, this question can arise: is light not needed in order to recognise one another? — as sunlight is available upon the earth. The answer to this is just this: whatever light we human beings recognise at present, it is only on the basis of recognising light through the eyes. Whereas every substance is indeed luminous. The reason for this is just this: in every atom, activity in the form of effort, motion, and result remains present. In the outcome of motion, sound, heat, electricity, and wave remain manifest. At the root of activity, being energised and being magnetic-force-full remain self-established. The glory of the unit endowed with these four kinds of force keeps itself illumined in the forms of existing-ness and luminousness — that is, they remain illumined. From this we come to understand that every substance is luminous. The testimony of luminousness has already become entirely clear as being, in the form of reflection, present on every side of the unit. That reflection alone is the basis for recognising one another — this fact has already become understood. For this: place any substance in any one room; if we sit down naturally on every side, that substance does indeed come within the sight of all of us. By another method: our eyes, according to the construction of the visual organ, cannot see anything in a dark room without more light. There is no motion at all in the reflection of substances placed in the room. This is understood by this method: owls, which are active by night, and animals with similar eyes, do indeed recognise the substances they need. Just as owls and bats do recognise fruits, and the deer recognises grass. Whereas the human being does not recognise. Merely from the human being's not recognising, the substance does not itself

become an error in presenting itself, nor is it the case that there is no one else who recognises it either. It can be considered that the elephant, the ant, and the owl too do see it. By the method of investigation the conclusion emerges that each of their eyes remain formed according to their own respective necessities. In the same way the basis of the five sensations remains formed, because the arrangement for recognising something through the eye, something through the nose, something through the tongue, something through the skin, something through the ear, is found formed in the living human being. It can be thought that a similar arrangement will surely be present in all living creatures. Just as the frog's skin remains formed as it is, the feathers of many birds remain formed in different ways, and the cow's hide remains formed of its own kind — in all of these, tactility remains formed differently according to each one's respective necessity. In this way it remained natural for the tactility of the human body to remain distinct. We can accept, from physical knowledge, that the composition of the human body can express all five kinds of sensation with excellence, and can communicate tendencies. This good fortune makes clear the sense of equality present in every kind of human body. By way of indirect statement, sensation is present in all living beings. In this way it became clear what activity occurs, together with measure, in the animal order and the knowledge order. Every composition is one measure; in these measures, diversity of form is a matter for study in the forms of shape and volume; diversity of property in the forms of motion, work, and tendency; diversity of essential nature in being different across the four orders; diversity of dharma in being distinct across all four orders. This matter has already been made clear before as well. The material order is endowed with the dharma of existence, whose destruction is not possible. The biological order is endowed, together with existence, with the dharma of growth (*pushti*) — the evidence of this is the tradition of one seed transforming into many. It is by the logic of seed-and-tree alone that the whole of the biological order exists. The animal order, together with existence and growth, is endowed with the dharma of hope. Every animal wants to live; to live means to express sensations. There is nothing more than this. In the knowledge order, the human being, together with existence and growth, is endowed with the dharma of happiness — this too has been made clear along with this. Resolution alone is the evidential form of happiness. All-round resolution is what the human being expresses in the process of evidencing his own understanding. This expression, communicated, reaches, in, from, and for every human being, unto study, comprehension, realisation, and evidence, and is accepted. From this it also becomes known that the human being, in coexistence, expresses all-round resolution only by the realisation-based method, from which it is natural for the human family to be benefited. What is meant by the benefit of the human family is being within human awakened tradition, human universal orderliness, human undivided society, and, at the very least, human family orderliness. In family orderliness too, the human being, for the human being, or for the family,

is also motivational, and by this method resolution remains bound up with benefit. Or, by the method of benefit, resolution remains bound up. In this way, in the human being, it is precisely understanding that is meant by seeing; understanding alone is seeing.

When the human being is treated as one measure, its purpose becomes intelligible. Animals can likewise be studied as measures complementary to human beings, the plant-order, and the earth. Their excreta and respiration increase the earth's fertility and complement the biological order. Animals also remove many diseases of the plant-order: forests without animals show more disease among trees and plants, while those with many animals show less. The same complementarity is visible in crops, where weeds, insects, birds, and especially honeybees are beneficial; where these are absent, crops diminish, destructive insects increase, and new diseases arise. The earth's adornment therefore deserves attention. It has arisen through complementarity and usefulness. The biological order appeared only after the material order, with its various species of atoms, had been established on earth; each order is complementary to the other. As the biological order develops, fertility increases, and greater fertility advances the biological order by increasing excellence among shrubs and plants. This is qualitative change (*gunatmak parivartan*), or development. The biological order is useful to the animal order, and the animal order complements it. Male and female cells first arise within the biological order; in the animal order, female and male body-compositions become mutually distinct. Thus, however far cell-compositions in the biological order

advanced, they were insufficient for the animal order and required further development. Distinct male and female body-compositions consequently became manifest in animals. The biological order also provides their food, making complementarity and usefulness entirely clear among the material, biological, and animal orders. After biological cells attained satisfaction, their further composition-method enabled them to participate in animal body-compositions. In some animal bodies this incorporated the seven metals (elements) and produced the most enriched brain composition. Such a body provided the natural system in which biological cells could join through reproduction and compose the human body. This composition could arise from various animal bodies in different geographical environments, as indicated by the body-compositions of humans of many races. Each race may therefore trace its fixed point (*dhruv bindu*) to the accomplishment of the human body from a basic animal body, with a characteristic colour accompanying it. This provides a conjecture about the beginning of human lineages through innumerable generations, linking them to the development progression. Humans of diverse racial colours then secured their traditions in their respective geographical conditions, just as other animal traditions remain secure in their own colours and forms. As the most developed body-composition, the human body is the most useful for jeevan. Human beings seek to sharpen cognisance in the process of evidencing it. Their study is consequently evidenced as knowledge, wisdom, and science. From the coexistentialist viewpoint, fullness in these disciplines and participation with human-ness in orderliness and the overall orderliness are necessary and inevitable, and make it possible to explain what human beings have wished to know but left unknown.

By the above method it became clear that, of the whole of measures found in the four orders in existence, each single measure is itself an orderliness together with its inherence, and is a participation in the overall orderliness. This study has been presented for the human being to be meaningful precisely in the sense of participation, together with human-ness, in orderliness and in the overall orderliness.

In the discipline of measure, the study of form has already become clear for all four orders, in relation to form, property, essential nature, and dharma. Now it is necessary to become clear about property and essential nature. Essential nature is seen to be different across the four orders. In the material order, essential nature is seen in the form of the activity of combination-decomposition, or combination with one thing and decomposition from another. In the biological order, essential nature is found in the forms of vitalising (*sarakta*) and devitalising (*marakta*). Vitalising is in the sense of being abundant in oneself, and, secondly, in the sense of being useful for the animal order. Devitalising means the activity of creating obstruction in making one's own seed-arrangement abundant, and the condition of being disease- and death-causing for the animal order. In the animal order, essential nature has been recognised in the forms of the cruel and the non-cruel. Non-cruel means not killing any other living beings, not eating flesh, and continuing to live on plant foods. In this way both the cruel and the non-cruel become clear. In another language these are known as the carnivorous and the herbivorous; in a third language they can also be called the violent and the non-violent. The essential nature of the knowledge order is fortitude, valour, generosity, kindness, grace, and compassion. These themselves become clear as the human essential nature. Human-opposing essential nature is reckoned in the forms of baseness, wretchedness, and cruelty, together with covetousness of others' wealth, others' wife/husband, and inflicting pain on others. Those who remain in these tendencies are reckoned among the animalistic human and the demonic human. Both of these are human-opposing. There remains the possibility that those with human-opposing essential nature may gradually be transformed into humane essential nature. It is on this very basis that meaningful education is proposed — in other language, coexistentialist education is proposed.

What is meant by fortitude is remaining entirely clear about, and evidenced in respect of, human justice. Study and tradition alone are the sole basis for becoming entirely clear. Tradition is the bearer and carrier of the work of study; study keeps on occurring in the present. What is meant by valour is precisely this: remaining committed in faith and in behaviour to justice oneself, and, while remaining evidenced, dedicating and surrendering one's own body, mind, and wealth so that justice becomes accessible to people. This too becomes meaningful only by the method of education, and by the method of education for the populace. Generosity's

meaning is precisely using the resources of body, mind, and wealth available within oneself through the methods of usefulness, right-use, and purposefulness. Usefulness means deploying these resources for bodily nourishment, protection, and the movement of society. Right-use means dedicating and surrendering objects while participating in undivided society. Purposefulness means participating in universal orderliness by the self-motivated, self-governing method.

Kindness means making substances available according to worthiness (*patrata*). Grace means enabling worthiness in relation to the available substance when commensurate worthiness is absent. Compassion means establishing both substance and worthiness when neither is present. Through kindness, grace, and compassion, the human being becomes glorious as the human, the deific human, and the divine human. Such glory is highly useful for the country, the earth, and the human being.

The principle of measure, in summary form, becomes intelligible in this way: the substance existing in the form of each single unit is a unit-measure. In the unit, form, property, essential nature, and dharma remain present in an indivisible form. Each and every atom alone is the root measure. That the root measure is the atom has become clear for this reason: that the unit which is defined is one that is itself an orderliness and participates in the overall orderliness. Where a unit exists but does not participate in orderliness, even in such units a tendency for participation in orderliness is nonetheless found — as with an atomic particle, or a deluded human being. A particle, in itself, is not able to evidence orderliness — that is, it is not able to express a determinate necessity — and therefore every atomic particle is propensive in the sense of participating in an atom and, as a result, evidencing orderliness. It is precisely determinate conduct that becomes known as orderliness. From this it becomes known that atomic particles recognise one another and carry each other out. The human being's recognising the human being is, even now, a necessity. There is one and only one thread for recognising the human being — human-ness; it is necessary only in the sense of the human goal. The human goal is resolution, prosperity, fearlessness, coexistence. It is only in the process of evidencing the human goal that we are able to make humane conduct clear. The evidence of this is in the forms of value, character, and ethics. To succeed at this universally, or in all humankind — or for it to be so — is the glory of awakened human tradition. On this very basis, every human being becomes, in himself, an orderliness together with human-ness, and comes to participate in the overall

orderliness — participates in undivided society, in universal orderliness. Therefore every unit in existence is known in the form of measure; the human being too, by recognising human-ness, and evidencing the human goal through determinate humane conduct, is reckoned in the form of a measure. In this way every atom, as the root measure, and every composition, is reckoned as a measure.

3.10 Property, Essential nature, Dharma (गुण, स्वभाव, धर्म)

Property consists of generative, degenerative, and mediating activities and tendencies, and is assessed by their results. Creative and combinative activity is called generative tendency. Activity and tendency that decompose or destroy what has been manifested are called degenerative. The activities and tendency that maintain compositions formed through union and combination are called mediating. Every activity manifests as state and motion, and every activity has a tendency at its root. In every unit, propensity is dynamic and becomes manifest through mutual recognition; this can be recognised in every order, plane, and existent state. Every unit has a tendency to recognise. Recognising and fulfilling give rise to propensity, development progression, development, and awakening progression; knowing gives rise to awakening. On this basis, each unit's determinate necessity becomes clear as inherence (*tva*). Necessary propensity leads to necessary recognition and then to mutual recognition. Such recognition occurs only within orderliness together with inherence. Through mutual recognition, the units cease to be mysterious; nothing about them need remain unknown. Yet a question may arise during study: to what extent must every individual thing be tested? How long, for example, should we continue testing the sea drop by drop?

How long should we test atom after atom, or unit after unit in the biological, animal, and knowledge orders? Such a method can never reach the far shore. Every existent state, order, and plane is instead linked to the next like the rungs of a staircase. In the material order's development progression, physical substances from the smallest to the largest pass through many existent states and establish orderliness by expressing form, property, essential nature, and dharma: shape, volume, and mass as form; generative, degenerative, and mediating as property; combination-decomposition,

for essential nature; and existence, for dharma — we have already understood these. From this it becomes known that merely from testing one drop of the ocean we come to understand the water of the entire ocean. It is in this very way that the method of study is able to become meaningful.

By the above method, the study of the biological order too has already been understood: namely, shape, volume, and bulk, for form; generative, degenerative, and mediating, for property; vitalising and devitalising, for essential nature; and, together with existence, growth, for dharma. Beyond this, in the animal order, this has been evidenced in some animals as jeevan and body being in a combined form. In the elaboration of this: the presence of jeevan is evidenced in those animals endowed with a body composed of the seven metals (elements), an enriched brain system, and the capacity to receive the human being's directive signals. In such animals, jeevan too has shape, volume, and bulk; the body too has these — however exceedingly subtle jeevan may be. In jeevan too, the generative, degenerative, and mediating property remains at work. In the human being, jeevan predominates. For this very reason, the body's generative, degenerative, and mediating property becomes secondary. In animals, essential nature and dharma are in a combined form. Cruelty and non-cruelty become clear in the combined form of body and jeevan. The hope of living, too — dharma — becomes clear in combined form. The whole of the animal order is explained by the hereditary method. In the same way, further, the elaboration of the human being's generative, degenerative, and mediating properties too becomes possible. In the human being too, property is most predominantly on the side of the mediating, which is expressed in the form of one's own glory. So long as the human being remains deluded, he regards the being of the self as paramount, and regards others as secondary. It is precisely the manifestation of this very tendency that has, from the distant past, become clear in the forms of treachery, rebellion, exploitation, and war. In this too, it is only the acceptance of the glory of the self that remains. The glory of the self is held to be good. Only with awakening does one come to understand the fact of the glory of the self existing together with the good of all; through delusion one remains unaware of this. When faith is placed in this, one becomes awakened, and then one becomes free from degenerative properties. So long as one is not free from degenerative properties, frustration, despair, and torment remain in effect. This is what is called suffering in human tradition. The awakened human being's property is, for ever and ever, mediating. Its universal form is: keeping awakened tradition intact, keeping universal orderliness intact, and, through study, keeping the thread of undivided society evidenced. This becomes manifest in the form of keeping justice evidenced within the family. In studying all these facts, an entirely clear outlook of goodness, resolution, and truth becomes evidenced for the whole of humankind. This alone is what is necessary. It is by this very traditional method that the whole of study becomes intelligible. It is through humane properties alone that the human being's fundamental distinctiveness becomes mutually intelligible. In the same way, the units present in every state, in every category, keep on being evidenced in expressed form together with their respective property, essential nature, and dharma-form

itself. Across every order and plane other than the human, each unit is an orderliness together with its inherence. As a unit, the human too must awaken to the point where cognisance governs sensitivity. To be human means to know, believe, recognise, and fulfil the insentient and sentient (*jad-chaitanya*) nature present throughout the planes and orders of coexistence. In this way, wholeness and universality in the human, communality among animals, genus and species among plants, and the many existent states of the material order — differentiated by the number of particles in the development progression — are evidenced. Although existence is diverse, the arrangement of quantity across these orders and planes, through which the human family is recognised, is a subject for study within the thread of coexistence.

3.11 Strength–Power (State–Motion) (बल-शक्ति (स्थिति-गति))

Historically, humans have made many conjectures about strength (*bal*) and power (*shakti*). With the advent of modern science, applications were made to draw further conclusions about power. Yet science has reached no complete conclusion, nor has it produced anything for humanness; this merits reflection. Science has attempted to identify pressure as force, and motion, waves, and flow as power. Examples have been presented as electrical waves and magnetic force, sound waves and pressure, and the waves and pressure generated by flow. These studies have, however, denied the mediation (*madhyasthiyakaran*) at work in all these phenomena. They are based only on excited motion. This raises the question: where are strength and power when motion is in its natural state?

From the viewpoint of Madhyasth Darshan, strength is manifest in state and power in motion. Power is introduced and recognised as a mechanical process when one unit manifests an effect upon another; it is recognised on the basis of state. Humans have many suitable (*samicheen*) — that is, nearby and available — ways to test this principle. Consider a stone: when we lift it, our apprehension of the conjunction between the stone and ourselves is called weight. Weight, of its own

accord, evidences the formula (*sutra*) of coexistence with the earth. Every human being clearly perceives weight in this way. Take an empty pot, fill it with water, soil, potatoes, or grain, and lift it: what is felt in lifting it is called weight. As one who gives concrete form to ideas (*manakar*), and as imaginative and free in action, the human being considered how weight could be measured and found an answer. Methods of weighing and measuring were established, followed by instruments capable of weighing and measuring ever-larger things, including the loads carried by trucks and trains. Everyone sees this daily. The entire phenomenon of weight is the arrangement (*vinyas*) through which coexistence with the earth is evidenced; it is a principle. In this way, weight is animated by coexistence. Every unit, forceful in state, evidences and displays power in motion.

In this sequence it comes into understanding that every object maintains its own orderliness within a definite good distance. For example, in one atom more than one atomic particle, remaining at a definite distance, manifests orderliness with inherence (*tva*) in the form of conduct, of which the human is the seer. If, within such a definite good distance, the distance increases, then the mediating activity working in the atom in the form of the nucleus (*madhyansh*) applies its force and calls the particles near. If an atomic particle begins to come close to the nucleus active at the centre, then too the nucleus, applying its force, fixes the particle at the good distance. This is the controlling activity that takes place in the atom. By these very activities, control over mutual distance remains. When atoms are in the form of molecules, it is on the basis of the nuclei that mutual attraction-force is exercised, on the basis of magnetic force-fullness. As a result, one atom joining with another atom is called a molecule, together with molecular bond. It is natural for such molecules to remain endowed with weight. Because of this very weight, the propensity remains for one molecule to join with another molecule while remaining within a definite good distance. From such propensities, atoms, molecules, and large material objects formed of molecules — bodies (*pind*) — stand presented before the human, such as this earth. All objects joined to the earth, together with this earth, up to the earth's atmosphere, evidence coexistence — solid with solid, liquid with liquid, rarefied with rarefied. The arrangements which the earth and the objects that are limbs of the earth make for this, we name falling from above, running, flying, and so on. From above, only all those things fall down which are in the form of solid and liquid.

The arrangement that a liquid object makes in its eagerness to evidence coexistence with liquid is called rain or flow. In the same way, the solid object that falls from above — that is the arrangement occurring with the earth, which happens in the effect of that object's evidencing coexistence with the earth. To this very arrangement the name of gravitation has been given. In reality this is nothing but the arrangement of a solid object's evidencing coexistence with a solid object. This is the respectful acceptance. In gravitation, the notion of small and big keeps running. In the form of coexistence it has been seen that each one, together with its environment, is complete. In this there simply is no small or big. This is confirmed by the fact that each one is orderliness together with its inherence. Both these principles are seen being fulfilled in the combined outcome of natural-state motion and definite conduct. In this sequence, each object being a constituent limb of this earth, honouring coexistence with the earth is, as a result, a natural propensity. The arrangement of this propensity remains bounded up to the atmosphere of this earth. This earth too, together with its environment, is complete. However many limbs and organs are contained in the completeness, all these remain bounded with the complete. 'Bounded' means evidencing a definite intent through a definite arrangement. Such definite intent is precisely the evidencing of coexistence — solid with solid, liquid with liquid, rarefied with rarefied. Whatever activity occurs in the course of evidencing coexistence, we call it arrangement. Its outcome is nothing but the evidence of coexistence. By this method the understanding that coexistence itself is existence becomes complete.

In relativity there is apprehension of small and big. Completeness slips out of sight. Only in completeness can each one be respected, be evaluated. It is the human alone who recognizes such evaluation and the standing of respect. When the human evidences each one in coexistence together with completeness, in such a situation it is found natural for the human to give attention toward his own completeness. Contrary to this, by the relative method attention goes toward small and big. Considering oneself big becomes a necessity. To keep that intact, keeping the other small also becomes a necessity. In this sequence treachery, revolt, exploitation, starvation, bombardment — all these deeds get done. When there is dialogue about them, their impropriety is accepted. In this manner the human becomes self-contradictory. Such a situation we address in the language of 'belonging neither to home nor to shore'. From this very thing indeterminism gets prepared. As a result the human falls prey to every kind of frustration or

excitation. He moves away from natural-state motion. As a result, asociality and disorder come to hand. Unanticipated events in the form of disorder take place. This has proved entirely unnecessary for the human race. Therefore, as its alternative, it became necessary to be endowed with natural-state motion, state, and — along with certainty — hopefulness with definite plan, and evidence. This, by the method of coexistence, is at hand for all humankind.

The central formula is the evidencing of coexistence itself. It is natural to evaluate coexistence in every work-arrangement, propensity, endeavour, activity, behaviour, and result. The human being alone performs this evaluation.

Human beings have long awaited their own evidence through the coexistential, or truth, method. To fulfil this expectation, study of the coexistential activity-system proved sufficient for human beings to evidence humaneness in behaviour. Its unveiling was therefore necessary. Coexistence alone is the ultimate truth.

State-motion is the combined form of pressure and flow. Pressure may remain without visible flow: a stone rests upon the earth, and the water in a pond shows no flow. A river, by contrast, visibly flows, and its pressure is evident. Water flows down a slope that ultimately joins the sea; by the natural method, or the method of destiny (*niyati*), the water of rivers therefore reaches the sea. Water pressure and flow can each be converted into another kind of pressure and flow, with pressure as the principal cause of change. Steam under definite pressure, for example, can operate particular machines and produce magnetic electricity. Magnetism is thus evident as pressure and the electric wave as flow. One kind of force can become the agent of another force and flow. Human tradition similarly learned to operate machines by heating — that is, burning — oily substances. Such machines perform many kinds of work, including movement on land, water, and air. Oil-combustion also operates machines that generate electricity, producing electromagnetic flow and pressure. In the same way, heat released from radiant (radioactive) materials can operate electricity-transmitting machines;

human beings have learned to operate these as well. Their discharges and residues — from minerals, coal, oil, and radiant materials — have become causes of pollution, as studied earlier. As alternatives, attention has been directed toward the flow-force of water and must also be directed toward wind, ocean waves, and solar heat for obtaining magnetic electric current. Only then can human beings be freed from a gravely criminal, polluting tradition opposed to destiny, development, awakening, humanity, and the earth's environment. Examining state-motion by the method of existence — that is, ascertaining it through testing, observation, and survey — shows that every unit expresses strength in state and power in motion. This is equally true of units from the smallest to the largest. As established earlier, every unit endowed with state-motion is itself an orderliness and participates in orderliness. **Strength in state evidences orderliness in oneself; power in motion evidences participation in the overall orderliness.** Every unit is energised and forceful because it remains saturated in the omnipresent reality. The atom lies at the root of every unit and functions in physical, chemical, and jeevan activity. Jeevan atoms are free from molecular and weight bonds but, while deluded, remain bound by hope, thought, and desire. All other atoms participating in physicochemical activity remain joined by molecular and weight bonds, through which small and large structures form. The atom is the smallest structure. Atoms manifest grandeur as molecules and molecular structures, all animated by the formula of coexistence. More than one particle in an atom, more than one atom in a molecule, and more than one molecule in a molecular structure are all evidence of this formula. Structures are either physical or chemical, and their mutual complementarity and usefulness are clear. Molecules of every kind continually express both state and motion; these activities and expressions have always been present and never cease. The human being is therefore a unit fit to study them and must evidence orderliness in state and participation in the overall orderliness in motion.

Only then is the evidence of mental wellbeing (*manah svasthata*) presented in tradition. Without mental well-being, all-round resolution in the human is simply not possible. Therefore mental well-being is for the human an utterly essential or supremely necessary attainment.

In this sequence, understanding naturally enables the human being to manifest mental well-being as all-round resolution. This grandeur — endowment with resolution — succeeds in evidencing prosperity, fearlessness, and coexistence. Such success is the succour and *pran* in, from, and for the human tradition. *Tran* means state; *pran* means motion. Inspiration in motion, orderliness evidenced in the environment or sphere of effect, and being an orderliness oneself in state together form meaningful grandeur. Human beings naturally hope to maintain such grandeur. In the atom likewise, strength in state and power in motion establish a sphere of effect. A good mutual distance preserves the spheres of effect of both units. Every unit that maintains its originality within mutuality through such effects is under control.

A good mutual distance means that each unit's sphere of effect remains formed and secure. This sphere of effect, as well as state, shape, volume, and mass, exists only in the omnipresent reality. Shape is present only together with activity. In every atom, activity takes the form of effort (*śram*), motion, and result. **Effort is the grandeur of an existent state; motion is the grandeur of spreading effect; result is the grandeur of a different existent state. Every result is thus arranged in a quantitative and qualitative chain.** Results may be fixed (*dhruva*) or long-enduring, distinctions that become clear in assessing the stability and instability of existent states. Threaded by the formula of coexistence, every existent state is meaningful through complementarity and useful complementarity. The meaningfulness of all things thus becomes intelligible. A molecule has the same history: molecules join with other molecules to form a body while maintaining field control in relation to each atom's sphere of effect. Human beings contribute nothing to this process. Through complementarity and usefulness, these activities evidence meaningfulness up to awakening and its continuity. Every stage remains joined to the others. Physical activity cannot be separated from chemical activity, chemical activity from the activity of living beings, or physicochemical activity

apart from the activity of the human, no work or behaviour is accomplished, nor can it be accomplished. All these remain inseparably joined with the human. They keep honouring their bounds indeed. For honouring the bounds with these, the human needs to be informed.

All other-than-human nature is useful to the human being, yet the human failure to complement it has become the basis of every problem-creating propensity. This failure also obstructed the use and right-use of attainments produced through giving concrete shape to ideas, because mental well-being remained neglected. Its critical necessity is therefore clear in the present. Mental well-being is universally attainable only by the coexistential method; this is the clear possibility of universal good. Human beings become capable of evidencing mental well-being only after becoming endowed with resolution. The completeness of understanding is itself mental well-being, and understanding is the spontaneous acceptance of coexistence. Complete knowledge thus takes the form of acceptance, while every human being retains the right to accept or reject.

The grandeur of state-motion is present in the earth, the solar system (*saur vyuh*), many solar systems, each galaxy, and all galaxies. Study makes everything from the atom to the earth accessible as evidence in its own state-motion. Beyond this direct study, the state-motion of other planetary globes is accepted, as is that of a galaxy through the activity of its many solar systems. The omnipresent reality is accepted together with them. Within this vast field of acceptance, studying one's own necessities as evidence is itself a human necessity, and the extent of such study depends on that necessity. The vastness of knowing and believing has already been accepted in relation to Omnipresence and the infinite. On this basis, studying one locale or one unit provides assurance about the form, property, essential nature, and dharma of all units of that kind. By testing one drop of seawater, for example, we accept what the water of the whole sea is like. But who is prepared to measure how much water it contains? We measure according to our needs, and human necessity is limited. Examining the activity of measuring shows that it

consists only of addition and subtraction; measuring and weighing apply the sequence 1, 2, 3. As one side gains, another decreases. Bringing addition and subtraction together reveals only the existent state: it is exactly what and how much it is. Such an existent state is neither more nor less and neither decreases nor increases; existence itself therefore neither decreases nor increases. The limits of testing accordingly depend on human necessity. Through addition and subtraction, human tradition has accepted the meanings of minus infinity and plus infinity. The infinite has thus been imagined or accepted as what cannot, to some extent, be enumerated. Until now, apprehension of the omnipresent reality has not been prevalent. Once it is apprehended, the nature of infinite objects becomes intelligible. Study as understanding — recognition that the infinite is inseparable in Omnipresence — thereby becomes the basis of all-round resolution. Every unit is present with its state and motion. “The present” (*vartaman*) means continuing to be current; to be current is to remain active; and to remain active is to make conduct clear. Clear conduct means orderliness together with inherence in state and participation in the overall orderliness in motion. The earth participates in one solar system, the group of planetary globes joined with the sun. Every planetary globe acts ceaselessly in its own state-motion. Without interfering with one another, they mutually recognise one another, perform determinate conduct, and participate in the orderliness of the solar system.

State and motion are therefore both present, and the earth’s state-motion becomes accessible to study. One solar system, arranging its activity with many others at a definite good distance, displays the grandeur of solar-system inherence. Scientists now call such an array of numerous solar systems, or planets, a galaxy. There are many galaxies, and by maintaining good mutual distance they participate in the larger orderliness.

3.12 Projection–Reflection (परावर्तन-प्रत्यावर्तन)

On the issue of state-motion and strength-power, the matter has already become clear with units from the smallest of the small to the biggest of the big, and that too in all planes (*pad*) and stages. Now we give attention to knowledge, thought, decision, evidence, result related to projection-reflection, upon knowledge being the witness.

Human beings seek to accomplish every activity in relation to a destination (*gamyasthali*). When a person begins to walk, the destination must be before them; if there is only walking and no destination, what would we call it? Every person can consider this. The same applies to ants, elephants, animals, birds, and other living creatures: each moves in relation to a destination, as shown by its arrival at some definite place. Even crocodiles swimming in water occupy definite, determined places. Some things occur everywhere on earth, others only here and there, and still others in very small areas. Air surrounds the earth; sunlight reaches one side and not the other; a river flows far and wide, while a mountain, shrub, or plant remains in one place. Humans and birds live on this same earth. People once thought that only birds travelled great distances; now human beings too roam the whole earth. Yet even while roaming, each person remains in some place. Being somewhere is inevitable and is joined with state-motion. There is no motion without state; motion is evidenced only together with a positive state. Human state-motion is clear: moving from one place to another displays both being and relocation. Projection and reflection proceed along with them.

We recognise projection and reflection within ourselves through recognising and enabling recognition, understanding and enabling understanding, and learning and teaching. Projection-reflection is clearest in understanding and making understood: through reflection we understand, and in making understood we project. Human activities are physical, verbal, or mental and may be done (*krit*), caused (*karit*), or intended (*anumodit*). Projection lies at the root of all these, and reflection at the root of projection; within the grandeur of reflection, projection proceeds by an interwoven method. Projection becomes meaningful only in relation to a person who wishes to understand — only then does making the understood understood fulfil its purpose. Projection must therefore be consistent with sequence, work, behaviour, result, and purpose. It becomes meaningful through production in work, justice in behaviour, human-aspiration in result, and, in purpose,

on the basis of the jeevan goal. The acceptance that these — that is, production, justice, human-aspiration, jeevan-aspiration — become meaningful is spontaneous in every human. This point has become clear earlier.

Every human being becoming endowed with understanding is an ordinary, common, and most desired event. Once understanding is present, all the other links join naturally. Together with understanding, the result must become a source of satisfaction. The result, the evidence of understanding, and the meaningfulness of all human work, behaviour, and orderliness arise through the fulfilment of human-aspiration. Humane orderliness, humane education, thinking, and thought likewise become meaningful only through its fulfilment. The central point is that when human-aspiration is fulfilled, jeevan-aspiration is fulfilled as a matter of course.

Projection has already been described as making the understood understood, teaching the learned, and getting the done done. Beyond these is intention (*anumodan*), which becomes meaningful through the same three senses. Human beings are projected through the methods of done, caused, and intended action. What is projected is the human being's fundamental form: endowment with knowledge, wisdom, and science. It is evidenced through those three methods. In this sequence of projection, the human being is evaluated within undivided society and universal orderliness. Undivided society recognises human necessities and establishes formula-orderliness; a third method provides explanation of meaning. The human being's place, in the sense of human necessity, from family orderliness to universal orderliness, has been clarified earlier. In this sequence, human meaning is evidenced and becomes meaningful. Complete knowledge, wisdom, and science therefore extend from formula to explanation. The seed of coexistence is fulfilled as aspiration, as the formula of knowledge-wisdom-science, and as the explanation of work, behaviour, and orderliness. This is the evidence of an awakened human tradition and makes the human being's spontaneous awakened propensity clear. Every work and behaviour undertaken as evidence is projection. Projection thereby fulfils its goal and intent, making the universally good, beautiful, and resolution-filled expectation meaningful.

Happiness is the intent. The human goal is resolution, prosperity, fearlessness, and evidence lived in coexistence; the expectation is universality and undividedness. Intent, goal, and expectation become meaningful through complementarity. When the goal is fulfilled, resolution is realised as happiness; resolution and prosperity as peace; resolution, prosperity, and fearlessness as contentment; and resolution, prosperity, fearlessness, and coexistence as bliss. In this sequence, realisation (*anubhav*) occurs in coexistence and in undivided society and universal orderliness; freedom is realised in production beyond necessity, and resolution in every activity. These are recognised as happiness, peace, contentment, and bliss. Every person can test this against their own realisation. We verified the result only after living it; satisfaction lies in universalising it among people.

For every person, the realisation-oriented method — study, research, testing, and observation — evidences human-aspiration through realisation and, in projection, through a realisation-based system. Study, enlightenment (*bodh*), the realisation-oriented method, and the realisation-based system thus enable living in accordance with human-aspiration. This is the fundamental aim of study. As the number of people living by this method grows, undivided society and universal orderliness are evidenced, followed by resolution, prosperity, fearlessness, and coexistence; every awakened person can then be recognised. Every man and woman wants to awaken. Universalising education fit for awakening is therefore the only means. Humane education treats every issue necessary in, from, and for the human being as an object of study.

In this manner the human tradition does remain projected in the form of becoming successively more awakened. In reflection it does remain drenched in happiness, peace, contentment, bliss. Human-aspiration does get evidenced in itself by the work-behaviour-orderliness method. This alone is what living means. That is, work, goal, and purpose being evidence, and their continuity remaining — this alone is what living means.

From within the human race, knowledge, science, wisdom is evidenced. This alone is the form of undisputed innateness (*svatva*). In the projection of such innateness, on the basis of the assessment and acceptance of meaningfulness alone, assessment keeps forming in innateness; being evidenced from within ourselves toward continuous excellence does keep coming about. Once evidenced, a chain of excellence forms in the evidence method. This becomes the formula of firmness in reflection. In the human, only by the evidence method does meaningful capital, by the reflection method, keep growing continuously sharper and increasing

indeed. Increase means that evidence in one matter today is joined by evidence in two matters tomorrow and three thereafter. Reflection preserves these attainments in enlightenment and realisation as acceptance, and this accumulated acceptance becomes the basis for further projection. Realisation is established in enlightenment as resolution, which can then be evidenced through projection. Reflection therefore makes projection a continuing source for realisation. This is the formula and explanation for evidencing awakening: every reflection is a formula of realisation, and every projection explains that formula. **Through reflection, the human being evidences knowledge, science, and wisdom; through projection, participation in work, behaviour, and orderliness.** This is awakened tradition, and maintaining it from generation to generation is every human being's duty and obligation.

Projection–reflection activity can now be studied in considerable detail. Within tradition, consciousness-development value education-sanskara is an interwoven activity: teaching occurs through projection and study through reflection. Teaching is heard articulation (*shruti*), or language. Study aims to enlighten the reality (*vastu*) in existence that language signifies; this is reflection. By the realisation-based method, enlightenment of every reality in coexistence can be projected. Study therefore follows a realisation-oriented procedure, and teaching is its corresponding projection. Enlightenment of meaning and realisation are the outcomes of study. Reflecting enlightened meaning into realisation is natural because every meaning refers to a reality in existence. Without the light of realisation, study cannot enlighten reality. Every such enlightenment attained thus far has been evidenced in realisation and presented for study.

The complete study of the human being as reality-enlightenment was not possible within materialism, because chemical-physical phenomena account only for the body. Every human being exists as the combined form of jeevan and body and is present through tradition. The body is one principal basis of tradition, which proceeds from generation to generation. Yet body tradition is limited to formation and deformation, whereas in human tradition jeevan and

body evidence a combined superior status. That is, it makes clear glories greater than the body. Where there is body and jeevan is not, in such a situation there is no human. Therefore in the designation 'human' there is acceptance only of the combined form of jeevan and body. This too has already come into the human's understanding. It is the body that is living and lifeless; lifelessness is simply the separation of jeevan. Livingness itself is the proper expression, the manifestation, of jeevan and body. In this sequence, recognizing human satisfaction and jeevan satisfaction has been a necessity. With human satisfaction, jeevan satisfaction does become meaningful. The study of this fact has become clear before. Human satisfaction being in the form of the goal — human jeevan is evidenced becoming meaningful. In this very sequence, for study, the human adopted the realisation-oriented procedure by the realisation-based method. Its clarification and mention is what is here. Attention to jeevan satisfaction by the human's spontaneous method is necessary for this very reason: that only with the deployment of jeevan strength and power do body protection, nourishment, and societal motion (*samaj gati*) become clear. In the situation of jeevan not being there, the protection and nourishment of the body cannot occur. On the contrary, such a body is declared a dead body and is consigned. In this way we come to this conclusion: body, nourishment, protection are accomplished only with livingness. Therefore, as much as we are able to know, we are able to desire less than that; as much as we are able to desire, we are able to do less than that; as much as we are able to do, we are able to consume less than that. The result becomes known: as far as the limit of consuming goes, it is the body alone. For the nourishment and protection of the body, the use of things has been recognized; and the activity-processes of things useful for societal motion have also been recognized. The tele-communication machines and instruments that are employed or are useful for societal motion are given the name telecommunication, in which far-travel, far-seeing (television), and far-hearing are included.

In the awakened human tradition, the use, right-use, and purposeful methods of things get accomplished and get evidenced. Usefulness — that is, the limit of a thing's usefulness — becomes clear in the form of family-based necessity. Production more than necessity has become possible in the human tradition for this reason: that whatever we produce, however much we produce, we are not able to consume that much. Therefore the formula of production more than necessity becomes clear. This production more than necessity became spontaneous by this method: that there is inexhaustible power and strength in jeevan; production work being accomplished in the combined form of jeevan and body;

its use being limited to body nourishment, protection, and societal motion. Even while human tradition remains deluded, relatively few people engage in production while many more use what is produced. Production beyond necessity is therefore evident even before awakening. Straying arises from the lesson that “necessities are infinite and means are limited, so necessity can be fulfilled only through struggle.” This directs attention toward accumulation and comfort, neither of which has a point of satisfaction, and leads to the assumption that necessity is infinite. Escape from this delusion requires clear evidence that every family’s necessity is limited, the possibility of fulfilling it is greater, jeevan’s powers are inexhaustible, production occurs through the combined activity of jeevan and body, and the body’s necessity is limited. Attention then turns toward prosperity, whose source is production beyond the family’s necessity.

Within a family, one or more persons can produce beyond its natural necessity; in an understanding-endowed family, two to four may possess this capacity. Production beyond necessity enables such a family to evidence resolution and prosperity, bringing happiness and trust to its members. Each member becomes able to trust oneself, respect excellence, evidence understanding, behave socially, and remain self-reliant in vocation. This capacity arises from the human being’s place in the knowledge order (*gyanavastha*). Because existence-as-coexistence is continuous, knowledge of the holistic view is continuous; because jeevan is continuous, knowledge of jeevan is continuous; and because humane necessity is continuous, knowledge of humane necessity is continuous. On the basis of these treasures of knowledge, wisdom-endowed science and science-endowed wisdom ascertain how the jeevan and human goals are evidenced. This is the management, treatise, thought, and holistic view of coexistence — existence-based, human-centred contemplation knowledge, Madhyasth Darshan.

In this sequence, in every dimension, the unceasing possibility of being endowed with the holistic view, thought, treatise knowledge has indeed remained formed. That is why the human tradition's becoming awakened is an inevitable situation. For this, existence-spontaneous inspiration is evidenced in the human of the knowledge order, is eternally effective. Therefore the human is assiduous in thinking, understanding, being evidenced. In this very sequence the human's comprehensive resolution (*abhyudaya*) gets evidenced. The human's comprehensive resolution, in its own form, gets evidenced only in the form of all-round resolution — that is, complete resolution. Complete knowledge alone is complete resolution. Because only on the basis of knowledge do science- and wisdom-aligned resolutions emerge in the form of decisions. This is an inexhaustible activity; it is a continuous, ever-and-ever activity.

This fact has become clear: that the human, on the basis of understanding, in the course of being projected, presents realisation-evidences, in whose outcome jeevan-aspiration and human-aspiration being evidenced becomes clear. Along with this it also becomes clear that, by the realisation-based method, the methods of making the understood understood, teaching the learnt, getting the done done become meaningful through realisation-based projection. In this very sequence it has been indicated that whatever is the human's production, it is to be use within the limit of his family, right-use in the meaning of society, and purposefulness in the meaning of universal system. It has also been indicated that the human's necessities are within the limit of body nourishment, protection, societal motion. Societal motion is in itself the combined motion of undivided society and universal system. Undivided society has in itself become quite clear earlier.

After all families are endowed with resolution and prosperity, where will they deploy things — this question does arise in the same form. It has been realised that once a human family is endowed with resolution and prosperity, the propensity of benevolence (*upkar*) dawns. Only the people's representative of an understanding-endowed family will participate in the overall orderliness. Whatever things get deployed for societal motion, all these remain provided from the prosperous family alone. Up to this point, in every condition — that is, however awakened one may be, even after that — deployment does occur. In this way, only together with societal motion are humans able to evidence orderliness. A people's representative participating in orderliness will be of some family only. However many things are needed for their body nourishment, protection, and societal motion, all that will remain provided by the understanding-endowed prosperous family. In this way, from every family,

participation in societal motion, contribution, and the use, right-use, and purposeful deployment of things are naturally ensured. This state–motion is the grandeur of awakened human tradition.

This account of the awakened human being's spontaneous projection–reflection activity arises from the need to study particular issues. Its root intent is that every man and woman evidence awakening in a healthy, beautiful, and pleasing manner, endowed with good fortune. Recognising awakening, understanding, knowledge, science, and wisdom as the supreme good fortune of every human being is spontaneous. Pleasant state–motion is evidenced through mutual recognition with resolution, prosperity, and trust; trust in happiness also rests on resolution and prosperity. In awakened human tradition, beauty is recognised as personality — food, lifestyle, and behaviour practised according to understanding. The observance (*sevan*) of behaviour carries relationships together with their values, evaluation, and mutual satisfaction. Both service and being served are contained in such observance, and relationships are honoured according to their purposes. The chief purposes are to evidence awakening, the human being within orderliness, and human aspiration. Recognising every relationship in terms of these purposes is the grandeur of understanding.

Only the human being evidences the full range from imaginativeness and freedom of action to understanding, honesty, and participation through study, application, and evidence. The possibility and attainability of understanding are the same for every human being, regardless of size, strength, complexion, country, or time. Evidencing this attainment provides the complete frame in which human tradition becomes clear within orderliness. This human grandeur can be evidenced only through projection–reflection. With understanding as its purpose, the human being projects and reflects the formula and explanation of undivided society and universal orderliness. Study, teaching, values, evaluation, resolution, prosperity, and fearlessness, evidenced as coexistence, are readily attainable

and accepted. This being evidenced is itself the purpose of projection-reflection. This is also the purpose of the human tradition. This alone, by the destiny method, is the destination-site. This alone is the necessity of all humans.

3.13 Pressure, Flow, Wave, Electromagnetic Force (दबाव, प्रवाह, तरंग, विद्युत चुम्बकीय बल)

Pressure — the compulsions received for generative-degenerative (*sam-visham*) excitation (*āvesh*), as distinct from natural-state motion, are pressure.

Flow — the continuous motion of fluid matter (*ras dravya*) toward a slope is flow.

Wave — waves occur in different forms and by different methods in solid, liquid, and rarefied matter. In a solid, a wave is vibrational motion. In a liquid such as water, contact with air, a substance, an animal, or a human produces an up-and-down vibrational motion called a wave. In rarefied matter, sound (*śabda*), heat, electricity, rays, and radiation are evidenced in wave form.

Electric wave — this is the flow produced from the fragmentation of magnetic current. The small-small forms into which the magnetic current gets fragmented — those pieces are transmitted through some medium, that is, they run. Regarding the medium: the whole of nature is the holder and carrier of electric current. The whole of nature is receptive to electricity, at the least or at the most. This being less or more gets determined by the method of pressure, flow, and measure.

Sound wave — sound waves and language waves. Sound arises from the collision of more than one thing or from self-motivated activity within a single thing. Rubbing two stones together produces sound, as does striking two metals against one another or the movement of leaves in the wind. Humans produce sound through the combined action of the throat, palate, lips, and tongue; this is called melody (*rāga*), and it too is sound. Cows, oxen, buffaloes, goats, and other animals each produce sound in their own manner. The sounds of animals, birds, frogs, and so forth may function as language for their respective species, but for the rest of nature they remain sound. In the same way, human language may carry coherent meaning for humans,

but for the rest of nature it is only sound. Some animals imitate human signals. Through this distinction, humans understand the clear forms of sound and language. Word-waves that indicate meaning are called language waves. Both sound and language waves exert pressure upon every rarefied substance connected to their site of production. This pressure sets the surrounding atmospheric molecules vibrating; that vibration is what we call a wave. Transmitted from molecule to molecule — that is, propagated — waves travel far and wide. Broadcasting such words and sounds through electrical conduction is understood as radio and television waves. We need to understand word-waves in this way because every word humans use must retain its meaningfulness in our view: we ourselves seek to be meaningful. Meaningfulness has already been explained. Its formula is that the human being understands, lives in behaviour and orderliness, and evidences jeevan-aspiration and human-aspiration. Every word must therefore be used meaningfully.

Humans encounter electromagnetic waves naturally as lightning or light. Thunder is the sound produced when two sufficiently dense clouds draw near one another from their definite good distance. As they approach and their relationship with the earth is joined, electric current flows of its own accord; its effects upon animals, humans, trees, and plants have been observed. This is lightning's naturally visible light and effect. Travellers used the light to see their way, but the current was not put to any other constructive use. Observing both the light and the current, humans asked, "What is this? What is it like?" and reflected extensively. Eventually, light was produced by rotating a dynamo — which fragments magnetic current — with a bicycle wheel. Thereafter, electric current was progressively made to flow and perform work across the earth; all of this is now evident.

The declared analysis regarding electric current is on two points:

1. The source of electric current, and

2. The activities occurring in the current, in the flow.

Electric flow arises from the fragmentation of magnetic current and therefore remains inseparable from magnetism; the name “magnetic electric current” is consequently meaningful. One hypothesis holds that atomic particles run with the current. In practice, the contraction and expansion of molecules that persists as natural-state motion in every medium increases when that medium carries an electric flow. Pressure is maintained through contraction and flow through expansion. The electric flow then affects the rarefied substances in its surrounding environment, forming a field whose pressure and flow may range from very slight to very great.

Electric flow, within the limits of control, is not any harmful thing in itself. Nor is it, in itself, any pollution-laden energy. This electric energy is in itself pollution-free. Whether pollution is produced from its use or not depends on human wisdom (*vivek*). Making oneself well regulated in this is naturally easy. On the other hand, the need there is to become engaged in obtaining it — that is, electric energy, electricity — this being pollution-free is possible only when we are able to see the earth’s balanced temperature as the priority point. Today it is precisely this view that is needed. The form of the view is seen doing meaningful work in the form of mentality — knowledge, wisdom, science.

By the coexistentialist method of knowledge, wisdom, and science, we can bring into attention the coexistence of the earth and the human. In the situation of the coexistence of human and earth coming into understanding, the earth’s health coming into the priority position, and the aim of freedom from pollution coming into the priority position, will remain a natural process. The alternative is clear from before. There is need of giving a little attention.

Whether we use the force of water flow or not, the flow does remain formed in every place and time. The precision of seasonal balance being the source of the unbroken current of these rivers — this is acceptable to the understanding human. Along with this, how much the proportion of forest and minerals ought to be upon the earth — attention to this too is quite clear. The point of giving attention in this is just this, that in every place (*desh*) different situations have formed. In every difference, the seasonal balance of that place remains quite clear in itself.

By alternative methods — that is, by the pollution-free method — it is necessary to obtain more electricity than what we are getting; for all the vehicles that run on roads, for them there is the need to store up electricity by the battery method, so that the smallest to the largest vehicle can run. Its availability can become such as mineral oil is available. Every understanding person can accept this. As far as the matter of vehicles running in fields and vehicles moving in the air is concerned, for them we will make vegetable oil suitable and use it. For ships moving on water we will keep all three adopted — vegetable oil, or solar energy, and the battery method. In this sequence, if the human mind gets readied, if the human once applies strength, then in the technological world — that is, humankind grappling with flow-force — the sinful deeds and criminal deeds happening against nature can stop.

We have understood that, by the method of destiny, the human being appeared after the plant and animal orders. Despite this, human beings have committed crimes against destiny and must become free of them. Whether or not we use water flow and solar heat, both remain available: water continues to flow and the sun's heat continually touches the earth. Through knowledge, wisdom, and science, these sources can be used technologically to provide many times more electricity than human beings need.

Every human keeps the wish of remaining rich in energy sources. The understanding human does keep living in the meaning of ensuring use, right-use, and purpose. From this, the basis for human trusting human is also probable. Only by the method of mutual trust along with humans

can both the aforesaid kinds of sources be used. By this alone can the human on this earth become free from these destiny-opposing, human-opposing, nature-opposing programmes. In place of opposition, being mutually complementary, useful, and cooperative gets evidenced.

Magnetic force-fullness has already been identified at the root of energy activity. A student may naturally ask where it comes from and how it arises. Every thing is submerged, saturated, and enclosed in the omnipresent reality. Saturation gives energy-fullness; energy-fullness is forcefulness; and forcefulness is present in every unit as magnetic force-fullness. The atoms and molecules of every species therefore possess bonding, weight, and force.

The omnipresent reality permeates all things throughout nature, so every unit remains saturated in it. Human beings infer that a thing is energised when they witness it manifesting energy. Once all things are understood to reside in Omnipresence, its source becomes clear: the omnipresent reality is the fundamental uniform energy (*samya oorja*). The perpetual activity of molecules, atoms, and atomic particles shows that each is energised. Their state and motion evidence energy-fullness and forcefulness, which appear as magnetic force-fullness, molecular bonding, and weight bonding. Although complete in themselves, these units also evidence their necessary complementarity with the whole, including the earth. Solid, liquid, and rarefied substances cooperate with and are useful to others of their kind. Every configuration that forms part of the earth's grandeur is thus naturally expressed. Human craft and mechanics may produce and transmit electric current, but that flow ultimately merges back into the earth and evidences coexistence.

Magnetic substances occur as constituent matter of the earth itself. Their mutual mechanical arrangement produces magnetic current; fragmenting that current produces electric current. Once its purpose or use is complete, the entire electric current merges into the earth and is converted back into magnetism. This process is described here because electric flow is recurrent or cyclical and must therefore be maintained as a necessity. It is appropriate to reorganise the venture-method toward this end by joining it to perpetual sources. The sequence thus proceeds from magnetism to electric flow and back to magnetism. Since magnetism neither decreases nor increases, it is proper to recognise the whole process as saturated in the omnipresent reality.

Magnetism manifests in things. When two magnetic substances are mechanically fixed face-to-face at a definite good distance, a magnetic current forms between them. This current is the tendency to meet one another. The molecules and atoms in rarefied form between the substances lie within the magnetic field. When that field is fragmented, the medium receives the resulting current and carries its flow over distance.

Whether or not a distinct material object remains formed during fragmentation, every void (*avkash*) contains some number of molecules, and these molecules lie within the magnetic current's field of flow. During fragmentation, molecules in this field are naturally affected by the electric current. It can also be inferred that magnetic effect and fragmentation pressure may disintegrate molecules into atoms, or atoms into atomic particles that race along with the electric flow. In any case, the flow's effect upon the medium and the resulting activity are clear. As soon as electric current flows through a medium, contraction and expansion increase within it. Any inquisitive person who wishes to understand through application can test and observe this.

However many ventures have been made for electric flow, and however many instruments have been made for controlling the flows, regulating them, dividing them, using them, measuring them, and making them definite — they seem sufficient. If, in the situation of some further need ahead, the research-investigation tendency is there in the human anyway. From this, supply is probable. Being assured by this, necessarily using the perpetual, continuously obtained sources for operating electricity-executed machines will itself be our fortunate future.

Among the attainments that have come, up to today, from the industrious human in the form of the battery, there is the cell battery and the plate battery. In the first, the cell battery, one carbon plate is found; around it, chemical matter and a casing of zinc or lead is found. The chemical matter that remains inside it, reacting with the lead or zinc, becomes excited in the form of molecules and keeps transmitting electricity in its field. These fields, joining one with another, remain joined with the carbon. That is why electric flow is able to become available in it. From this battery we see bulbs burning.

A plate battery likewise contains acids, salts, and other chemical substances. Metals naturally react when they contact these substances. An applied electric flow affects the metal plates in the battery casing; through chemical combination, their molecules become excited and receptive to electricity, which is called “charge.” The charged battery can then provide light and operate crafts and vehicles by supplying electric flow when a machine starts. Human beings have become adept at producing, controlling, and applying electric flow by these methods. The remaining need is therefore not further technical knowledge, but ensuring use, right-use, and purposeful deployment without disproportionate exploitation of nature.

3.14 Place, Direction, Distance, Area, Angle (देश, दिशा, दूरी, विस्तार आयाम, कोण)

Every human wants to examine all these issues. For knowledge, for understanding. What is the meaning of distance? What is its purpose? Every human’s attention does go to this.

Distance is rooted in the human being, the eye within the human being, and the various mutually situated things reflected upon the eye. Things remain reflected in human eyes: some appear nearby and others far away. Thus we see the sun, moon, and stars at a great distance, while the earth, air, water, mountains, plants, insects, animals, birds, and humans appear nearby. Things continually reflect upon the eyes. They exist when we see them and also when we do not. On this basis, we seek both to understand distance and measure and to explain them to others. Whether far or near, every unit remains contained within the omnipresent reality, yet nearness and distance still appear to us. Distance therefore reveals that we realise our condition of being submerged in Omnipotence. Measurement becomes possible because between any two units only the omnipresent reality is present as the measure. Distance can be established in two ways. To determine the unknown distance of the sun, moon, or stars, two poles or cones are installed on the earth and the celestial body is treated as their common target; the distance is then determined from the different angles at the two points. The second method measures a distance within a known composition. The composition is known while the distance is not. On earth, for example, we measure one kilometre, two kilometres, and so on. The earth is itself a composition. We begin at a cone or pole point and measure to the point whose distance is sought. The distance is then known; we are aware both of the act of measuring and of what was measured. We must now also understand what measure itself is.

When the human had need of weighing small things on the physical balance, then, taking the subtlest weighing of the physical balance as a definite point, the fragmentation method was adopted by the mathematical method, on the basis of its tenth parts and hundredth parts. Moving forward in this very sequence, by electronics, by the technological method, hundreds of thousands of divisions in each square inch — dividing the square into hundreds of thousands — numeration was done. Its use is indeed being employed in the form of the electronic recorder. For generation after generation ahead

to use, all these are available. In the sequence of measuring length, breadth, and height, the measuring thing remains made of some metal or other or of wood. Such length, breadth, height — or rather, all lengths, breadths, heights — are contained in the Omnipresence; this fact is known to us. Whatever we measure between one thing and another thing, between pole and pole we are measuring Omnipresence itself. The distance between these two we take to be its definite distance; we numerate it. We keep clear confidence.

Whatever is measured as distance between units is the omnipresent reality. Measuring standards treat each unit as measured through the span of Omnipresence between defined points. Length, breadth, and height encompass all units. The earth and every thing upon it remain submerged, enclosed, and saturated in the omnipresent reality, yet measurement is carried out within the name and bounds of each thing. Because coexistence is the ultimate truth, both measurement and weighing succeed, as does numerical subdivision based on their standards. By living with restraint, human beings have developed standards that register increase and decrease from the subtlest to the grossest signal. Such standards enable the recognition of things, motion, pressure, waves, and words by comparing degrees of motion and pressure; they have proved especially useful in telecommunications.

Expanse (विस्तार)

(Expanse, in itself, is equal to the span of the composition.) Whatever length, breadth, and height a composition, a unit, is spread over — that is its expanse. At the root of composition, this fact has become known to us: from atoms, molecules; from molecules, molecular compositions; the matter of being small and large has become clear. Many earths like this earth are also compositions composed from molecules. On many other planets and spheres too there can be solid, liquid, and rarefied things like this earth's. Planets and spheres of many kinds do remain reflected before our eyes. We also know this: far-far away there can be very many earths. Regarding this earth too, an endeavour was made to recognize corner after corner. The wish to recognize other earths does remain in the human. For this, by the technological method,

endeavour has been made for a good many years. All this will keep on being possible at its own pace, in proportion to the endeavours. The main issue is that of the human on this earth living together with mutual trust.

Living through trust begins with trust in oneself. This is evidenced by honouring excellence, expressing talent through personality, being social in behaviour, and self-reliant in vocation. Every human being seeks the dignity of trust; in this lies the meaning of self-trust. Only then does human tradition become assured upon the earth.

The earth has a definite expanse, confirmed through human standards of measurement, and its terrain is self-evident. It is a complete composition formed through the coexistence of molecules of many species. Chemical structures have spontaneously manifested upon it up to the human body. The human being, as the combined form of body and jeevan, is entitled to study the earth, other planets and spheres, and cosmic rays, and receives their benefaction. Yet the human being's study of itself remained incomplete and required fulfilment through knowledge, wisdom, and science. Composition's spread is understood as expanse and measured in units such as miles and kilometres. The earth's surface presents unbroken abundance, foremost in its forests. Maintaining this abundance requires commitment and activity to preserve the seasonal balance described earlier.

Place (देश)

The expanse of a composition is its place. Conventionally, the earth has been named as many countries, but considered honestly it is one composition with a definite expanse. The earth is neither divided nor fragmented; its undividedness is evident to all despite attempts to divide it into countries and states. The earth's undividedness also inspires human beings

to recognise themselves as an undivided society. Human security on earth becomes possible only after this undividedness is recognised; so long as human beings remain fragmented, the earth remains liable to damage. Because the earth is one composition, all units indivisibly present within it participate in its undividedness. Every composition on earth is likewise complete as a unit. An earth on which all four orders are evidenced is developed or developing, and this makes its composition and magnificence intelligible. The method of undividedness therefore makes undivided society and universal orderliness accessible for human study and evidence.

Every plant, animal, and human being on earth is an individual composition, and each has grandeur only together with the earth. The earth and every tree, plant, animal, and human being evidence a composition with a definite span. Their length, breadth, height, and weight can be measured, as can those of stones, gems, and metals. The magnificence and span of compositions, together with their mutual complementarity and usefulness, thereby become clear.

Only on the basis of composition does the matter of decomposition and re-composition become clear. The earth, a composition in itself, is present in the meaning of its continuity, in the meaning of clarifying development in the development progression and of clarifying awakening. Because upon this earth all four orders have been evidenced. The earth remains limited to its own composition. Upon this earth all orders and statuses have been evidenced; they have become present in zero-attraction (*shunyakarshan*). On this basis, when a composition becomes endowed with complete grandeur, then these four orders manifest. Together with the four orders, the magnificence and dignity of this earth has become quite clear. For instance: when the four orders are not upon an earth, then the human too is not there. Only after coming to be, the human, out of delusion, has done earth-opposing work. There itself, with awakening,

it is necessary and opportune for the human — in accord with this earth, that is, in the sequence of evidencing development and awakening — to set himself in order, to evidence himself, and to make his work and behaviour clear.

Direction and Sight (दिशा और दृष्टि)

Conventionally, a person facing the sun recognises front, back, right, and left as east, west, north, and south. The origin and purpose of direction are determined within coexistence, which contains complementarity and usefulness. Recognising direction requires taking one thing as a pole or anchor, such as the human being together with the earth. A point becomes the centre of many degrees (*ansh*); joining two degrees at a distance from that centre forms an angle. Every point may therefore define infinitely many angles through combinations of degrees.

In the aforesaid way, every thing is a center point, and in every center point infinite degrees remain joined. As before: by spreading 45 degrees, as one set, far and wide, there are 8 directions on all sides of a thing. In the same way, by the division method of 90 degrees, 4 directions are formed; upon dividing by 180, 2 directions are formed. In this way, for determining direction, it comes into understanding by the method of one thing being the center of many degrees. The second method is just this: one thing in front of another thing — about the sun in front of the earth we know from before. In both these disciplines, the angle (of some center) becomes clear on the basis of degrees. Because the sun too, and the moon too, is a center of infinite degrees alone. Whenever direction is determined on the basis of the sun, it will be at 90 degrees or 180 degrees of the sun. 90 degrees is formed on the basis of the one recognizing the direction; 180 degrees is formed on the basis of being seen.

In the form of the seer, we have already recognized the human. In whichever direction the human's sight runs, with both eyes it forms just 90 degrees; the very name of this is the span of vision (*drishti pat*). The beginning of the 90 degrees is in a point. This point is right behind the two eyes, at the very place where the nerves of the two

eyes join; it remains established in the brain (*medhas*) system itself; it remains established in the form of a physicochemical system. The visual system remains active, in itself, together with the chemical composition system and, including livingness, with mentality. The meaning of this turned out to be that only in the presence of the human (*jeevan*) can the matter of awareness of direction, time, and so on be spoken of. Even if, by the mechanical method, we do direction- and time-related activity, in that too all the activities stated before do remain related to the human. Hence, at the root of instrument evidence, the human alone is the evidence. At the root of self-evidence too, the human alone is, because the human alone is the evidencing unit. At the root of book evidence too, the human alone is the evidence. In this way, in the sequence of understanding the human's method of evidence, understanding the human visual system also remains necessary.

The span of vision, out of itself, forms an expanse of 90 degrees in every human's visual system. In this sequence, upon every thing coming into the span of vision remaining at a definite good distance, its expanse is able to be cognized through the visual system. The activity of cognizing occurs only in *jeevan*. Through the visual system as well, it comes into understanding on the basis of human *jeevan* and body being an indivisible form. Such grandeur-endowment is a necessary process. This can be recognized with research in every human — in oneself too, in others too.

For recognizing direction and place, being endowed with sight is an indispensable condition. Without it, the ascertainment of direction, recognition, and the evidence of usefulness are not possible. In this — principally in the context of sight, in the context of recognizing the seen, and in the context of evidencing usefulness, complementarity, and purpose on the basis of these recognitions — the human alone is the sole capable unit. The need of determining direction is upon the human on this earth. There is dealing also with the planets and spheres existing outside the earth. In this sequence, for moving in the sky too, direction-determination is a necessary condition. It is necessary in water voyages too. On the earth, for going from village to village, direction-determination is extremely necessary. For the awakening progression, for recognizing awakening too, a definite direction is needed. In this way, on the basis of human tendencies being multi-dimensional, on the basis of their being multi-angled, it is found that work-determination happens only on the basis of direction-determination.

By the land-moving, water-moving, sky-moving methods, wherever we have to move, for that the need does remain of determining the destination (*gamyā sthali*). Only after such determination are we able to reach the definite goal, the destination, only by the definite-direction method. Every person can test this on the smallest to the largest issue.

Beyond this, it has also become quite clear that without sight, direction simply does not get determined in itself. Direction-determination becomes possible only together with sight. The center of sight is the human alone. It is in the human alone that the sight of understanding remains contained. Together with the visual system, along with the knowledge system, the activities of thinking, thought, direct recognition (*sakshatkar*), enlightenment (*bodh*) including visualisation, and realisation (*anubhav*) are accomplished in the human. For this, it is necessary to keep recognizing the coexistence of jeevan and body in the human. On this issue clarification has been made before as well.

It is clear that sight in the human becomes meaningful in all dimensions, angles, and perspectives only by the coexistence method. That is why it comes into understanding that goal and direction-determination happen only with sight foremost.

Angle (कोण)

In the context of angle: after recognizing some one unit in the form of a center point, it has become quite clear that very many degrees are contained in the point. However many degrees we can conceive of, more degrees than that remain joined in one point. Upon establishing, at such a joined definite point, the target line that joins the parallel line (the base line), angles are able to become clear. Upon joining every two degrees, an angle of definite degrees does get formed. In this way, in each one, from one up to infinite angles are contained. The recognition of degrees happens only on the basis of straight, concentric lines. Concentric line means a line joined to one point and spread out on all sides; this has been recognized by the name of the degree-dividing line. By this very method — concentric lines, a great many joined in one point — every one of us persons can make this figure. As the distance of such mutual lines from the center goes on increasing, so the mutual distance between the lines also goes on increasing. In this very sequence, the span of vision gets recognized. It becomes clear as well, accepted as well. Degree, angle, expanse, distance — all these are facts within the reach of human sight. That is why, keeping human sight in the basis, the method of recognizing all facts is formed. In the same way, by a second method: after recognizing two poles upon some flat composition, and — on the basis of this same understanding — after recognizing three poles, upon joining poles with poles the recognition of angles occurs. Every angle is a figure of some definite numerical degrees. In this way, both direction and angle become clear. Along with this, distance too becomes clear.

Dimension (आयाम)

We commonly speak of three dimensions even though a thing is bounded on six sides, because seeing all six sides requires at least three viewpoints. Every unit remains submerged, saturated, and enclosed in the transparent omnipresent reality. Within the human span of vision, its position and circumstances are reflected in the eye as sight-points (*drig bindu*). At any one time, the eye can receive no more than 180 degrees of a thing's complete shape and volume. Every person can verify through observation that only part of a thing is reflected: when one human being faces another at a definite good distance, only the facing half of the other's length, breadth, thickness, and build is visible; the rest remains hidden. Sight alone is therefore incomplete, as are decisions and programmes based on it. Human beings do not accept such incompleteness in their search for satisfaction. Mathematics provides more awareness than the eyes but less than understanding. A picture formed from sight also remains incomplete because it contains only 180 degrees of shape and volume, whereas mathematical language can communicate the complete dimensions of shape and volume. Even mathematics, however, conveys less than qualitative and causal language, because the completeness of a thing comprises form, property, essential nature, and dharma. Only awareness of all four can provide complete understanding and satisfaction. A decision based on complete understanding,

and expressed in work and behaviour, produces resolution. This is understandable. Human beings do not accept problems; they accept resolution. Decisions grounded in completeness across every direction, angle, and dimension give rise to resolution. Every person can examine this directly.

Every application and decision that humankind has based solely on the eyes has ultimately generated countless problems. Instrumental evidence cannot exceed the eyes; this is the strongest evidence of that limitation. Science has therefore used the eye to develop instruments that see at progressively subtler scales: powerful lenses magnify hundreds of thousands or tens of millions of times, and electronic lenses have come into use to magnify billions or trillions of times. Yet even an eye made billions of times more powerful yields only what an eye can yield. The sole necessity is therefore to recognise the whole from the coexistentialist outlook through the combined method of knowledge, science, and wisdom; to communicate it in causal, qualitative, and mathematical language; to understand it; and thereby to attain human-aspiration and jeevan-aspiration. Direction and sight are indispensable to evaluating this. We already know direction geographically and astronomically. Two further dimensions must now be recognised: the direction of development and the direction of awakening. The direction of development means that the human being determines, practises, and attains the result of work and behaviour through complementarity and usefulness with the chemical, physical, and animal orders. The direction of awakening means evidencing harmony (*sangeet*) and concord (*samarasyata*) in human beings through understanding, honesty, responsibility, and participation, and thereby evidencing jeevan-aspiration and human-aspiration. Human beings must succeed in both directions. The coexistentialist outlook is the perpetual resolution for this.

From the standpoint of human contentment, only after clearly internalising the dimensions of form, property, essential nature, and dharma can a person make resolution-oriented decisions about development and awakening and thereby become meaningful in those directions. This is the summary.

3.15 Time (काल)

The definition of time in the form of ‘the duration of activity’ is clear. Activity, in itself, does keep being accomplished continuously. Along with it, some activities keep recurring. The continuity of such recurrence remains formed. It never stops at all. On the basis of one recurrence of such continuously accomplished activity, the basis for recognizing time was accepted. In one rotational motion of the earth, day and night are accomplished over the whole earth. This has been given the designation of one day. Such day-and-night activity has come on from ever and ever, and will keep going on. Dividing this duration by 24 parts, by 60 parts, we recognize it by names such as hour, minute, *ghati*, *pal*, and so on. In this manner we went on dividing time, and forgot the activity. We made ourselves ready to evaluate every activity on the basis of time. Time became primary; the thing was forgotten. From all the decisions taken on the basis of this mistake, problems arose. The need remained for evaluation to occur on the basis of activity and its outcome.

It is clear that time-reckoning is in the form of the duration of activity. Activity, in its form, is continuous, perpetual. Time-reckoning is in the meaning of being, of continuing to be. Coexistence, in itself, is in the meaning of being eternally continuous. Eternal continuity being is clear. It is this continuity that comes under the designation of time, and perpetuity too comes under the designation of time. On the basis of the whole of nature being perpetual, on the basis of its being imperishable, perpetuity is evidenced. Because the entire material order is present in the form of existence dharma; this very material order, having developed, on the basis of flourishing into the biological order, has come into recognition as being of growth dharma together with existence. In all animals, or in the animal order, being of hope dharma together with existence and growth has come into understanding. In this very sequence, it is also clear that the human is of happiness dharma together with existence, growth, and hope. In coexistence, realisation = resolution = happiness; that happiness is only from realisation — this matter too has become quite clear. By this method it comes into understanding that existence is imperishable. That is why time is only the ever-present. In the form of the present thing there is coexistence alone. It is the present that we have given the name time. In the word time (*kaal*), the meaning is the present alone. In the form of the present there is coexistence alone. In this way it comes into understanding that time, in the meaning of coexistence, is the ever-present.

Those who recognize time in the meaning of past and future — they too recognize it only on the basis of the duration of activity. Because every cyclicity happened before as well, is happening even now, and will keep happening ahead as well. By this method, on the basis of the event,

we construct past, future, and present. Through imaginativeness and freedom of action, human beings divide the duration of a natural activity into many parts until they reach a point at which time is taken to be zero. This small operation is extremely easy: divide an hour into 60 parts, then divide one of those parts again. After several such divisions, ask how much remains, and the answer is “almost nothing” or “nothing.” Yet this became a basis for human beings to go astray. Recognising time therefore became exceedingly complicated in the age of science; it even seemed impossible.

If the present becomes zero, where can human conduct and behaviour be recognised? Where can human knowledge, science, and wisdom be recognised? Human beings, beset by problems, therefore began to create further problems and regarded this as bravery. Human tradition has become deeply immersed in this. The only way out is to recognise coexistence as the ever-present, development and awakening as eternally manifest, and the human being as the sole bearer of evidence of development and awakening. Only on this basis can human-aspiration and jeevan-aspiration be fulfilled.

3.16 The Human Being as the Combined Form of the Biological Order, the Human Body, and Jeevan

At the basis of the biological order, combinative (*yaugik*) method and tendency arise by the self-motivated method. If we study the conditions favourable to this, the background appears to consist solely in enrichment through cosmic rays and atoms of many species on the earth. No greater cause appears when we consider the combinative background on this earth. Cosmic rays and radiation are the sole source maintaining favourable cosmic conditions. They are still present as far as the earth's atmosphere. Whatever the rays reach becomes more evident in the earth's own light. Heat, too, stands in relation to the earth.

The earth and all its atoms are affected. In these conditions, other radiant sources continue to transmit radiativeness produced or spread from many earths through the effects of cosmic activities. This continues even now. The earth itself, being enriched with atoms of many species, also contains many active radiant substances. The combination of rays, radiation, and heat thus provides the background for all combinative activity. This may be accepted as the background for possible combinative events, beginning with the formation of water and continuing into acid and

alkali forms. Even now, in another form, combinations of acid, alkali, and water in different ratios produce various chemical substances before us. Changes in these ratios have always been assisted by molecules and atoms of organic and other species. In this way, acid, alkali, and water, together with these molecules and atoms, have helped increase the number of species of chemical substances.

Chemical substances have thus continued to become enriched on this earth. Their union and combination form nourishment-elements and composition-elements. This formation, brought about by the continuing combination of radiant rays and heat, remains evident today. The combination of nourishment-elements and composition-elements gives rise to the composition, presentation, and functioning of prana-sutras. These same elements become enriched in themselves as prana-sutras and their composition. Through the combination of heat and radiation, and through vibration, they bring about the manifestation of respiration activity together with the composition-method in prana-sutras.

Immediately after this, the form of biological cells as compositions made from cells becomes intelligible, along with the acceptance of the composition-method in prana-sutras that allows such compositions to be diverse. Once one kind of composition becomes enriched in itself, prana-sutras accept a second kind. As a result, compositions of the second kind, followed by other compositions in the same sequence, have become evident on this earth. All of these occur with the seed-tree method. The glory of plants, their composition and decomposition, and the continuity of this sequence are present as the existent state.

The residue of decomposed plants alone became the basis of the sweat-born world. This can still be tested: gather leaves before the rainy season, and those leaves produce many worms and insects as they rot. These worms and insects prepare the egg-born world. In this egg-born tradition, excellence in biological cells remained natural, or further excellence and further species continued to be spoken of. As the egg-born world became abundant, it established itself in water-dwelling, land-dwelling, and sky-dwelling forms. The biological cells of the womb-born world developed from those of the egg-born world. Most of the womb-born world became land-dwelling, whereas the egg-born world included all three: land-dwellers, water-dwellers, and sky-dwellers. Sky-dwellers were more numerous in the egg-born world. Subsequently, as

the womb-born world emerged, land-dwellers became more numerous. Fewer womb-born species were found among sky-dwellers and water-dwellers. In this sequence, many species developed in the womb-born world, culminating in the tradition of human body-composition as the final species.

In human tradition, the human being is the combined form of jeevan and body. Through imaginativeness and freedom of action, human beings began to carry out activities different from those of animals: felling trees, breaking stone, and digging soil; then building houses, making clothes, and adopting ways of raising children different from those of animals. These activities arose by the self-motivated method. Of these, house-building, clothes-making, and crop production became identifiable as the affirmative portion. These three kinds of activity became entirely distinct from those of animals.

The endeavour to gain knowledge of body-composition continued alongside these activities. Through the composition-method inherent in prana-sutras and biological cells, excellence continued to develop from the earliest human to the present principal form, while the human species remained as it is (*yathavat*). Human tendency may also have contributed to this ascending sequence. Today, however, knowledge of body-composition, its fundamental process and measurement, disease testing, and the preparation of medicines have all become entangled with commerce. This affirmative knowledge has consequently come under the control of a few, causing human beings the greatest difficulty. Reflection on becoming free from this problem is under way.

The principal issues are the tendency of biological cells in body-composition and, at the basis of that composition, the “festival” (*utsav*) of biological cells of two species. As a result, body-composition proceeds through the embryonic state, forming limbs and organs, hands, feet, and so on. By the end of five months, the infant’s composition within the womb is complete. With this completion, an enriched brain system is present, more enriched and complete than that of the animal order. These matters become intelligible. During this same period, jeevan becomes ready to operate the body, and the woman who is to become a mother understands the indication of this readiness. After the infant’s birth, the attention given to its care and nourishment a hundred years ago, the attention given fifty years ago, and the greater precision of care possible today all fall within the human being’s present study.

This raises curiosity about the tendency toward diversity of composition in prana-sutras: why does it occur, and how? Human beings feel the need to consider this question. The principal differences are in colour and form; no particular diversity is possible in the limbs and organs. This has already been understood through testing and inspection. Human beings today can identify many kinds of fluid matter precisely. Their deployment in different proportions gives rise to the body's colour. Overall, colour becomes known from the condition of the partly dried and dried biological cells in the body's outer part. The blood beneath the skin is red in everyone's body; colour is known from the outer part. What biological cells display after drying is what we recognise as colour.

Identifying human beings by colour has therefore failed to identify them precisely as human beings. The endeavour to recognise one another precisely has consequently continued. Colour may have predominated in mutual identification from very early times, while other bases were also sought. Race likewise remained predominant. For a considerable time, humans sought to maintain their identity through methods based primarily on colour and race; evidence of this can still be found in various places. In thought, however, there has already been a departure from this hereditary method of identification based on colour and race.

In this sequence, human imaginativeness and freedom of action sought fulfilment through the discipline of knowledge. Yet the diversity of the world had not been studied. Despite this limitation, people sought to investigate knowledge and become knowledgeable. They undertook all the proposed austerities, means, yoga, and practices for becoming knowledgeable, but evidence was still lacking. For consolation, they turned to the scriptures as a remedy and a basis. Religious texts and books were thus accepted as evidence. It was not accepted that the human being is the one who presents evidence. The point to recognise is that anyone who presents evidence concerning knowledge, science, and wisdom must be a human being. On this point, meaningful evidence could not be given to the world of knowledge-practitioners or to the coming generation.

From the coexistentialist viewpoint, the circulation of knowledge and wisdom alone was presented as the principal matter. Without this, there can be no freedom from the clutches of delusion. The alternative proposal therefore includes the beginning of the application of universalisation; a complete study of knowledge, science, and wisdom from the outset; the formula for making decisions; and an explanation of possibility. Here

the point worth noting is that the human body's journey on this earth has long been discussed. Jeevan, in itself, is eternally present as a conscious unit with imperishable power and imperishable strength. While these favourable conditions persisted, successive events of coming together continued within the family. Human beings first considered taking refuge in divinity, in God as the doer. The whole framework was woven around its ultimate end: a state of well-being in disappearance (*tirobhav*). Unable to gain trust in this, human beings turned to accumulating conveniences. These were not available to everyone, and the absence of a point of satisfaction again led to the acceptance of alternatives. In this sequence, coexistence was presented to the human being.

A great deal of study has already been done on biological cells and the formation of human body-composition. Human beings have also come to accept that they must live with hope, thought, and desire, and with evidence and resolve. This has become part of the natural process. On this basis, we are examining whether the change has occurred in human body-composition, in activity, or in the method of knowledge.

The basis of this examination must be the living human being. Inspecting and testing a dead body reveals how bones, nerves, and muscles remain balanced and what difficulties arise when their balance is disturbed. For the living human being to remain balanced, however, mentality and body must be coordinated. Knowers, scientists, specialists, and ordinary people all accept this. Mentality reveals and clarifies disease and suffering; it must be applied to recognise bodily difficulties and aberrations. Mentality alone recognises all of these. Yet we claim that instruments recognise them, and health matters have consequently come under the control of instruments. Every instrument, however, is conceived, planned, and produced by one or more human beings, and human mentality is embodied in its planning.

An instrument falls short of the expectations according to which it was planned. To put this mathematically: if its intended purpose is rated at 100, trust and use should be limited to 75 or less. This is also regarded as a provision for the instrument's safety. Every signal from an instrument must still be read by a human being, who reads it through their own mentality. From time immemorial

it has been believed that trade cannot run without dishonesty. If this were indeed the rule, what would become of all these enterprises? This is a matter for research and reflection.

The second discipline comprises Ayurveda and the Unani method, whose bases are almost identical. Taking the pulse and the doshas as their basis, practitioners listen to pulsation and its sound, trying to hear the body's voice. From this they infer and acknowledge bodily suffering and aberrations, plan and apply medicines, and place their trust in successful treatment.

The desired result of this application is becoming healthy. The form of the disease was determined and medicine prescribed accordingly. The sequence through which trust was earned in this process was called the practical-experiential method (*karma-abhyas*).

In the Ayurvedic method, the relative strength of a disease is recognised in various ways, and medicines are identified accordingly: medicines from forests, minerals, and animals. Their relative strength is recognised through union, combination, and digestion, and a medicine stronger than the disease is applied. This practical-experiential method thus proceeds systematically from recognising the disease to treating it. Every practitioner of Ayurveda must exercise diligence. As a result: recognising diseases — recognising medicines

recognising the relative strength of diseases — recognising the relative strength of medicines

recognising the dietary regimen and restrictions — recognising the accompanying vehicle (*anupan*)

Applying these together is called the practical-experiential method. This entire knowledge, proceeding by the scientific method, extends to the accompanying vehicle and dietary regimen and restrictions. Through its results, it can become evidence in the form of tradition.

The central point is this: following the establishment of a tradition of understanding human beings, the practical-experiential method undertaken with knowledge, science, and wisdom in the discipline of health and restraint works and develops in support of universalisation. In other words, the glory of this tradition's endeavours and commitments to living by the humane method is, in support of universalisation,

emerging. Through the coexistentialist method, the understanding human being is endowed with knowledge, science, and wisdom. Such a person is not an individualist but participates, beginning with the family, in universal orderliness and the overall orderliness. Work and behaviour are therefore arranged solely toward undivided society. It is natural for the understanding human being to be social, desire universal wellbeing, remain active toward it, hope to be evidenced, and practise for this. From the coexistentialist viewpoint, such a human being is useful in many ways. This desire is present in every human being, making the possibility of such glory becoming meaningful intelligible.

Participation in the discipline of health and restraint follows naturally from understanding. Every understanding human being also has the duty and responsibility to participate in education and sanskar, justice and security, productive work, and exchange work. Acceptance of duty and responsibility becomes naturally evident with understanding. Once there is understanding—that is, coexistentialist knowledge, science, and wisdom—there is no delay in accepting them: this acceptance is evidenced and made manifest through self-motivation. All of this has been ascertained through thorough testing and inspection. Every man and woman can test and verify it; this has been an important inspiration for human tradition.

Every human being is luminous and existent as the combined form of jeevan and body. Each lives by decisions based solely on their own acceptance. At the root of such considered decisions are realising the balance of knowledge, science, and wisdom, accepting it, becoming inclined to evidence it, and doing so. The sequence and process of evidencing it occur only through participation in the overall orderliness. Such a tradition of evidence inspires assurance and trust from generation to generation. This need remains forever in human tradition.

Testing and inspection by this method show that jeevan operates the body; jeevan is not operated according to the body. The understanding human being operates the body according to their understanding. Understanding is the human being's boon, right, and supremacy, and is therefore the goal desired by all. The understanding human being can present every act, behaviour, and thought solely toward undivided society and universal orderliness. As a result, jeevan-expectation and human-expectation can be fulfilled. For this reason, once the human goal

has been recognised, work is arranged to fulfil it through actions done, caused, or intended. When the results of these actions evidence the human goal, living within orderliness is natural. Study of the understanding human being therefore makes clear that they operate the body according to jeevan—in other words, on the basis of understanding. We can trust this and research it: after awakening, the glory of jeevan is evidenced through the body in human tradition. This is the flow of resolution for tradition. Only within this flow is the glory of human tradition fundamentally evidenced. Every understanding human being desires to participate in it; every human being therefore wants to understand. The possibility of universalising understanding among all human beings is thus reasonable.

As explained earlier, human beings emerged on this earth only after the material order had become enriched into the biological order, and the biological order into the animal order. At the basis of this emergence was a qualitative change (*gunatmak parivartan*) in the composition-method within the prana-sutra. This change occurred by the method of a “festival” (*utsav*). Consequently, in different countries, times, and circumstances, human beings emerged from animal bodies endowed with an enriched brain system distinct from that of animals. Their fundamental expression, distinguishing them from animals, was imaginativeness and freedom of action. This was present in the earliest human beings and remains present today.

As these capacities were applied, whatever knowledge and attainment arose in tradition were naturally adopted by it. What was useful was accepted; what was meaningless was set aside. Research into human imaginativeness and freedom of action has continued in this way. Meanwhile, body-composition has remained as it is: however often it recurs from generation to generation, its form and the coordination of the seven dhatus (*sapt-dhatu*) at its basis remain as they are. All this testifies that, even after thousands and hundreds of thousands of years, the body’s substance, property, composition-method, limbs, sub-limbs, and organs remain as they are. The brain system has always expressed imaginativeness and freedom of action through the five sensations and the five kinds of organs of action.

The conception and endeavour to attain the point of satisfaction of imaginativeness and freedom of action have long continued and remain unchanged today. In these clear conditions, human beings have become most successful at giving concrete form to ideas, according to the definition. Mental well-being, however, remains an unfilled field. This is

the important question for research today. The principal task is for this barren field of mental well-being to flourish. This is also the basis of the conception of universal wellbeing.

Up to the first decade of the twenty-first century, the most fully evidenced discipline of giving concrete form to ideas has rested on refinement in the imaginativeness and freedom of action natural to jeevan, rather than refinement in the body. Materialism holds that consciousness arises from body-composition, but this has not actually occurred. Research into changes in the body and its composition proceeded through considerable manipulation; in the process, the distinctiveness of body-composition became distorted and buried beneath a barrage of questions. Even a Nobel Prize decision has been made on this basis. This line of inquiry entirely failed to present meaningfulness, evidence, or the possibility of a bright future.

Only a short time ago, the science of body-composition established the number of blood types; everything else had already been determined. It also became known that the brain system is the same in every human being. Caste, creed, sect, colour, race, language, country, and time have no effect on this. These conclusions have disproved the view that consciousness flows according to body-composition.

On this same basis, cloning technology assumes that propagating the prana-sutras of a person called talented can produce an identical body and identical consciousness. This too has proved to be a delusion. The commercial declaration of cloning specialists—"obtain your own replica"—has likewise become meaningless. It was previously believed that one inch of skin from a good, intelligent person could produce thousands, hundreds of thousands, and billions of good people. Once produced, anyone would adopt them as their own children, because everyone wants intelligent children. Attempts and endeavours were made and observed along these lines. In the applications carried out so far with sheep, goats, animals, and human beings, exact identity was not achieved: partial deviation remained.

Reproducing body-composition as it recurs naturally is not, in itself, a very important matter. This alone establishes nothing. Children of the learned have been seen to become fools, and children of fools to become learned. It is essential to keep this in mind.

Until knowledge of jeevan became available, we were willing, and compelled, to believe that form, property, and *sanskar* followed lineage. This belief supported arguments and advocacy for caste and lineage superiority. These have now broken down. Brahma-doctrine, self-doctrine, casteism, and racism have all become disputed, and doubt has consequently grown stronger. The assurance that consciousness is produced and transmitted through body-composition has also become disputed. The central question is therefore where the human being should turn.

An alternative proposal emerged from the last decade of the twentieth century into the first decade of the twenty-first: the coexistentialist worldview. Its method of study has been presented to make humanity intelligible as one undivided society. It makes clear the sameness among human beings in caste, dharma, and understanding—that is, knowledge, science, and wisdom—and in jeevan as a conscious unit, as well as sameness in imperishable power, imperishable strength, and the form of awakening.

We need, in this connection, to recognise and make meaningful the uniformity of jeevan-satisfaction and human-satisfaction. From the coexistentialist viewpoint, the human being is present and luminous as the combined form of body and jeevan. The account above shows that development does not take place in the human body. All the glory expressed from the earliest human being to the most modern is an expression of the freedom of action and imaginativeness found in every human being. This, too, has become clear.

Research and investigation into the point of satisfaction of these capacities—into freedom of action—disclose only the aspiration to be happy. In this process, giving concrete form to ideas becomes meaningful. This expression of imaginativeness and freedom of action is the glory of jeevan, not of the body. The body is formed only from the material substance and processes of the biological order. Its entire composition is predominantly made up of biological cells, which cannot exceed their own capacity. The standing established for human body-composition is seen to repeat as it is. Freedom of action, imaginativeness, and mentality are found in every human being; at its root, this mentality is itself a process of jeevan-awakening.

Among the activities continuously accomplished in jeevan, the first is mind (*mun*), the second is vritti (thought), and the third is direct recognition (*sakshatkar*, chitta). Chitta functions in understanding something, accepting its meaning, and accepting the thing together with its meaning. For example, accepting the substance water as present in existence together with the word “water” is an activity of chitta. In buddhi, enlightenment is the capacity to accept certainty and stability—in other words, to accept truth, dharma, and justice firmly. The fifth activity is realisation. Its glory lies in accepting and evidencing truth as ever-present resolution, happiness, peace, contentment, and joy, and in being filled with the assurance of joy. These five activities clearly function as the strength of jeevan.

Realisation itself is evidence, and its outcome is joy. In evidencing the innateness (*swatva*) of jeevan, the human being proceeds through resolve; imaging that projects resolve; analysis that makes imaging meaningful; and selection of the ways and methods by which analysis is put into action. The human being can be recognised through this evidence. These five projected activities are called power. Strength is called state, and the activity that projects it is called motion.

The awakened human being’s state–motion is thus clearly recognised through jeevan’s activities—that is, through the state–motion of jeevan. The human being has never been recognised through body-composition, nor will this ever be possible. We must therefore attend to change in jeevan. The main research and investigation to date have made clear the activities through which change takes concrete form; what remains is mental well-being. With knowledge, science, and wisdom made clear through the coexistentialist viewpoint, and through participation in undivided society and universal orderliness, human-aspiration and jeevan-aspiration can be made meaningful. Every man and woman can present evidence through application.

3.17 Knowledge, Knower, Object of Knowledge (ज्ञान, ज्ञाता, ज्ञेय)

Darshan — worldview: justice, dharma, truth; *drish* — the seer: human jeevan; *drishya* — the scene: coexistence;

Dhyan — concentration: awakening; *dhyata* — the one who concentrates: the human being; *dhyeya* — the object of concentration: freedom from delusion, jeevan-value, the natural evidence of the human goal;

Karan — cause: the knowledge order; *karta* — the doer: the human being; *karya* — the effect: wholeness, participation in universality;

aim (*sadhya*): the seer-status, awakening; seeker (*sadhak*): the human being; means (*sadhan*): body and jeevan.

Human tradition has long considered knowledge, knower, and object of knowledge from the viewpoints of *Adhyatma-vada*, *Adhidaivika-vada*, and *Adhibhautika-vada*. These three disciplines have collectively been called idealism (*adarshvad*). Mystery is their common ground: that which is beyond the physical is mysterious; the deity is mysterious; and spirituality itself is mysterious. Mystery is therefore both the foundation and the destination of idealism. With mystery as both foundation and destination, differences of opinion necessarily arise. Various methods of application and practice were attempted within these disciplines. These endeavours ranged from practice and the use of means to yoga, meditation, worship, recitation, and prayer. The promised outcomes of all these acts were moksha and heaven. Both remained mysteries, and these were called the destination.

The foundation was mysterious in the same way. All creation, sustenance, and dissolution were said to occur from mystery and within mystery—from the void, from Brahma—or from some substance beyond physical activity. Thus mystery was both the beginning and the end. The end was the auspicious mystery of heaven and moksha: auspicious because heaven and moksha bring joy, and mysterious because it ends in mystery.

Idealism, which combines the intent of these three viewpoints, also gives an account of the scene, the seer, and the worldview. According to the proponents of Brahma, Brahma alone is the seer; Brahma alone, according to his own resolve, is the scene; and Brahma alone is the vision through which it is seen. The proponents of *Adhidaivika-vada* offer a similar account. Their documents set out three forms of learning: Shakti-vidya, Shiva-vidya, and Vishnu-vidya. In Shakti alone lie the whole scene and all creation, sustenance, and dissolution. Likewise, in each of these three disciplines, all this depends on the deity. Everything seen exists as the resolve of the deities in the form of the scene; the deity is the seer and also the one who beholds. *Adhibhautika-vada* similarly speaks of a mysterious seer, scene, and worldview more powerful than the physical.

The same account extends to knowledge, knower, and object of knowledge. Brahma or the deity is held to be all of these, as well as concentration, the one who concentrates, and the object of concentration. God or the deity is also accepted as the effect, cause, and doer. This is how the earlier traditions have spoken.

Materialist thought holds that differences in composition produce differences in consciousness, yet no evidence of this is found. Physical substance alone was taken to be the source of consciousness, but testing stone and soil reveals nothing of the kind.

From the coexistentialist viewpoint, studying the human being as the combined form of jeevan and body makes jeevan's standing as a conscious unit intelligible. Jeevan, as conscious nature, awakens through awakening progression; this awakening must be evidenced in human tradition. The conjunction of body and jeevan—that is, coexistence—is necessary in human tradition.

Ten activities are accomplished in jeevan: realisation and evidence; the enlightenment of realisation and resolve; the direct recognition and imaging of resolve; the comparison of images and their analysis; and the tasting and selection of that analysis. These ten activities are evidenced after jeevan awakens. So long as the body is taken to be jeevan, only four and a half of these activities can be accomplished; the remaining five and a half cannot be evidenced. This crisis torments the human being. Internal contradiction and the inability to evidence jeevan's powers cause suffering. The delusion of taking the body to be jeevan likewise causes problems, while external affliction leaves the human being agitated and in distress. As a result, treachery, exploitation, and war have long dominated the human family, or have been regarded as unavoidable. What more degraded picture could the human family present? This calls for reflection, even as human beings continue to regard this very condition as glory.

The coexistentialist method makes readily accessible the study of jeevan and body, of coexistence, of jeevan's indivisibility in coexistence, and of all the physical and chemical activities accomplished within coexistence. It also makes accessible the study of the activities through which chemical and physical substances, the entire plant and animal worlds, and human body-compositions are formed. Because the brain system is the most highly developed composition in the human body, jeevan's freedom of action and imaginativeness are expressed in thought, reflection, activity, and results. These results, in turn, prompt further thought and reflection. Research and investigation are thus directed toward the point at which imaginativeness and freedom of action are satisfied, because we seek freedom from treachery, rebellion, exploitation, and war. This aspiration is presumably accepted by most well-intentioned people. The need for coexistentialist study therefore remains.

Coexistentialist thinking enables precise study of knowledge, knower, and object of knowledge. Jeevan is recognised as the knower. Knowledge comprises knowledge of the holistic view of coexistence, knowledge of jeevan, and knowledge of humane conduct. The object of knowledge is to make human-aspiration and jeevan-aspiration meaningful through awakening. This entails evidencing the human and jeevan goals through undivided society and universal orderliness; this is the evidence that the object of knowledge has been made meaningful.

Seer, scene, and worldview are explained in the same way: jeevan is the seer, existence-as-coexistence is the scene, and the holistic view of existence is the worldview.

Concentration, the one who concentrates, and the object of concentration also become clear in this sequence. Awakening is the object of concentration, and concentration is accomplished through understanding. In the process of evidencing understanding, the one who concentrates is recognised as jeevan.

Doer, effect, and cause are likewise clear. Jeevan is the doer; establishment in the human, deific-human, and divine-human statuses is the effect; and the ever-present standing of existence-as-coexistence is the cause.

The coexistentialist viewpoint also makes it easy to identify the seeker in relation to the aim and the means, and connects this identification with purpose. The human being is the seeker, and jeevan-awakening becomes accessible as the aim. Awakening is recognised as human innateness, freedom, and right. These take the form of understanding; understanding as knowledge, science, and wisdom in turn manifests this innateness, freedom, and right. This is the evidence of awakening. Every individual can consider how meaningful the aim of awakening is.

Imaginativeness, freedom of action, and evidence embodied in tradition are the means of research and investigation. When human tradition evidences itself as the bearer and carrier of evidence and authenticity, that very understanding provides the evidence of universal orderliness and undivided society. Participation in evidencing universal orderliness makes this evidence accessible to all. Humane education and *sanskar* flourish as a constituent part of universal orderliness. The grandeur of universality in human tradition becomes meaningful through knowledge, education, and *sanskar*. This is what the tradition of evidence means. A general

survey shows universality—that is, acceptance throughout humankind. Across the disciplines of practice, study, work, behaviour, and orderliness, the coexistentialist method forms a connected succession of evidence. Every man and woman can readily take it to heart, examine it within themselves, and determine whether it is meaningful or meaningless.

The human being's aim is awakening. Its innateness, freedom, and right take the form of knowledge, science, and wisdom. Their evidence, through work and behaviour, is undivided society and universal orderliness. These are linked in a chain from which no link can be separated. The aim embodied in tradition—human-aspiration and jeevan-aspiration—cannot be evidenced without coexistentialist knowledge, wisdom, and science. It can be evidenced only through the coexistentialist method.

Coexistence is neither mystery nor struggle. It is naturally intelligible to all human beings and hoped for by them, because every human being wants to live and find happiness in mutuality with someone. In this way, the glory of coexistence becomes intelligible.

In living together, the first presence we encounter is another human being, who is accepted in one relationship or another: first as mother, immediately afterwards as father, then as brother, sister, friend, teacher (*guru*), preceptor (*acharya*), elder, or neighbour, along with other similar relationships maintained in tradition. In living, nothing becomes clear apart from relationship. Relationship is the basis for mutual recognition and fulfilment according to purpose. Recognition without fulfilment and fulfilment without recognition are both impossible in this method.

Purpose is our desired attainment. Forming and fulfilling relationships for that purpose is inevitable; this is called responsibility and duty. Both arise naturally with relationship. Duty determines what is to be done and how. Responsibility determines what is to be attained and how, together with the inclination to attain it. In relationships, determining what is to be attained and determining what must be done, and how, to attain it are links joined to one another. These are fulfilled through the self-motivated method in most relationships. Only after awakening

does such fulfilment become clear. In delusion, the purposes and goals of relationships remain obscure. In deluded tradition, relationships are recognised chiefly through sensation-based tendencies, the accumulation of conveniences, and conflict. Having endured these viewpoints since the distant past, human tradition has been left barren in respect of mental well-being.

The coexistentialist method, however, makes mental well-being a viable and accessible possibility for all humankind.

Through this method, we can recognise all relationships in terms of their meaningfulness, their purposes, and purposes informed by cognisance. This becomes clear in universal orderliness and undivided society. Transforming work, behaviour, orderliness, and conduct through acceptance and evaluation of the evidence of human-aspiration and jeevan-aspiration is the outcome of coexistentialist knowledge, science, and wisdom.

Human-aspiration — the natural evidence of resolution, prosperity, fearlessness, and coexistence.

Jeevan-aspiration — happiness, peace, contentment, and joy.

3.18 Seer, Doer, Enjoyer

In awakened human tradition, fundamental right is evidenced through the seer, doer, and enjoyer statuses. In most countries, spiritual traditions prepared people to accept God, the Supreme Soul, Brahma, goddesses, and gods. Scriptures were composed for this purpose. At the root of all religions, the teachings written in these scriptures were accepted as divine speech, God's speech, or a voice from the sky. Such writings were regarded as sacred texts. This belief gave rise to texts and, through them, methods of preaching. These scriptures were composed when people in one country were unable to establish relationships with people in all other countries. Once they acquired this ability, communities began to study one another's religious texts. They found that teachings accepted according to one religious text were rejected by another. Where, then, was God's speech? Religious disagreements continued to deepen. Everyone naturally accepts that there should be a religious text. Along with this comes the self-motivated expectation that there should be no dispute in religion. If a dispute arises,

what remains of religion? There are human beings on this earth who reason in this way. Even so, the idealist method has not provided an undisputed religious text, while materialists see no need for one. We ordinary human beings have consequently remained tormented by internal contradiction and afflicted by conflict in the external world: treachery, rebellion, exploitation, and fear of war. We kept attributing all of this to the grace of God or a deity. Whenever we found relief or happiness in any matter, we regarded it as the grace of God, a deity, or a guru. In this way, ordinary people continued to endure joy and sorrow. Neither those regarded as ordinary nor those regarded as exceptional retained trust in themselves. Yet every human being recognises that trust brings relief, and this remains true today. We find relief in the relationships in which we can trust, whether for a moment, a day, or a year. By attributing this to the grace of God, a deity, or a guru, we have continually obscured our own role. Yet it is through their imaginativeness and freedom of action that human beings have succeeded in giving concrete form to their ideas on this earth. If this is not the human being's own creation, whose is it? Whether or not we understand this, it is necessary to reflect on it. Alongside this, resolution within human tradition is what evidences mental well-being.

Here we need to ask: does whatever appears before us have a doer at its root? Is there someone who does it? If there is no doer at its root, then the ascription of a universal-doer is mistaken. If there is no doer, what could the enjoyer-status be? If that is not so, what becomes of the seer-status? These questions arise one after another. The idealist method does not provide their answers.

When we began to think and reflect through the coexistentialist method, and to recognise decisions, we came to understand that everything functioning in the four orders of coexistence itself occupies the self-motivated doer-status. Activity is therefore seen to function as effort, motion, and result within the development progression. In this same sequence, awakening was recognised through the immortality of result, the restfulness of effort, and the destination of motion. It became possible to recognise the immortal status of result in terms of development, and the restfulness of effort and destination of motion in terms of awakening and awakening-completeness. In this way, the human being is understood to be the knower of the awakening-status,

its herald (*udghata*), and the unit capable of evidencing it. The preceding study makes clear that every entity is saturated in coexistence — that is, in the omnipresent reality — and is therefore energised and forceful. Every entity functions by the self-motivated method; no one is needed to make it act. All compositions, from the smallest to the largest, are active in themselves. This activity takes the form of effort, motion, and result. Within the development progression, the immortality of result becomes evident as the developed status. The constitutionally complete atom, which is the conscious status, is its testimony.

The doer-status is evident in the development progression. In the conscious status, during the awakening progression, jeevan and body together express the hope, thought, and desire to live. This is evident in the animal world and deluded human tradition. The hope to live brings wanting and not-wanting into evidence. Along with the wish to live, human beings express the desire to be happy and become capable of giving concrete form to ideas. The desire for happiness thus manifests as the human being's own mentality. Since the doer-status is already present, the expectation of the enjoyer-status arises: the expectation of enjoying happiness. This makes the emergence of the seer-status necessary. Understanding itself is the evidence of being established in the seer-status.

Understanding establishes the seer-status and, together with knowledge, the knower-status. The human being alone evidences the seer, doer, and enjoyer statuses. Human beings manifest their grandeur as the combined form of jeevan and body. The conscious unit's grandeur lies in attaining the seer- and knower-status. Consequently, as this is evidenced within human tradition, human beings also manifest their grandeur in the doer- and enjoyer-status.

The physical-chemical world occupies the self-motivated doer-status, while jeevan, in its awakened conscious status, is seer and knower. From the seer- and knower-status, use, right-use, and purposeful deployment of the doer-status make it possible to evidence jeevan-aspiration and human-aspiration. Remaining deluded instead brings affliction through problems. In the chemical and physical world, the doer-status becomes clear through the process of result within the existent state and development progression. The enjoyer-status accompanies the doer-status because result appears in many existent states. To see is to understand; understanding is the complete grandeur present in jeevan. In the conscious world, the seer-status is thus

established. This became clear through awakening and is the central point. In all chemical and physical activity, in the animal world, and in the deluded human being, the doer- and enjoyer-status have always been in evidence. Human beings can therefore succeed meaningfully as doers only through the seer-status, not while remaining deluded. Thus, the seer-status is naturally the glory of awakened tradition alone. Maintaining human tradition is therefore, for all of us human beings, an all-auspicious thread and explanation.

Nityam yātu śubhodayam [May auspicious dawn come forever]
