

The Ontology of Coexistence

Author: AnalyticMadhyasthDarshan.org — a group of people studying Madhyasth Darshan philosophy. Source repository: [raghavamohan/AnalyticMadhyasthDarshan](https://github.com/raghavamohan/AnalyticMadhyasthDarshan).

Edited on: June 24, 2026, 7:58 AM IST

The question: What is Existence? What exists? Does what exists begin at some time? Does the individual self (*jeevan*) begin or end with the body? Is the world finally real?

This study examines those questions in **Madhyasth Darshan** (Co-existentialism), as presented by **Shri A. Nagraj**, and compares its answers with **Advaita Vedanta** and selected **modern philosophical and scientific approaches** to physical reality, consciousness, and selfhood. Under the same ontological frame it also treats how Omnipresence and units relate through saturation, how change and causation work within beginningless coexistence, the structure of units and the four orders, how sentience arises at constitutional completeness without emergence from dead matter, and what is conserved when bodies and configurations begin and end. The full comparative treatment of time (*kaal*) — past, present, and future, *trikaalabadh*, and spacetime physics — is developed in [Nature of Time](#); this paper states only the core claim that *kaal* is duration of unit-activity and that *satta* is timeless as ground (§1.6).

Standpoint and scope

These studies are written from the standpoint of a **scientist and technologist** — someone trained to graduate-level **physics and mathematics**, at home with contemporary cosmology, quantum theory, conservation laws, and the logic of formal models.

From that background, a familiar picture of nature is hard to avoid: **consciousness appears as something the brain does** — an epiphenomenon, functional outcome, or emergent property of particular configurations of very large numbers of physical particles. Modern physics and cognitive science are powerful on mechanism, prediction, and public evidence; yet the hard problem of consciousness, the status of the self, and the reality of value remain fiercely contested. The standpoint taken here does not treat those gaps as settled in favour of matter-only reductionism.

The work begins where that scientific picture leaves open questions — and asks whether Madhyasth Darshan offers a coherent alternative worth examining seriously. This paper reads the primary texts carefully, states what follows from the darshan itself, and compares it in parallel with what we know from **physics and the natural sciences**, **Advaita Vedanta**, and **modern Western philosophy** (especially philosophy of mind). Physics and mathematics are **one leg** of that comparison, not the only one. The aim is rigorous comparative understanding — testing definitions, internal consistency, and fit with public knowledge — not persuasion or devotional endorsement.

This paper presents Madhyasth Darshan’s answers to what existence is, what exists, whether what exists begins, whether *jeevan* persists beyond the body, and whether the world is finally real — and develops the saturation, causation, unit-structure, sentience-threshold, and conservation claims that follow from that ontology — then subjects the whole to parallel comparison with Advaita Vedanta and selected modern scientific and philosophical views. Its standard of success is **coherence and comparative fit**: definitions that hang together, claims traceable to the primary texts, and responsible mapping against public knowledge. It does not claim that physics, neuroscience, or comparative argument alone establish immortal *jeevan*, constitutional completeness, or continuity across bodily death. Where traditions use different criteria of knowing, the dispute is treated as partially incommensurable (§6.5); exposed points are collected in §6.2. These topical studies state the philosophy in clear, checkable prose first. A separate formal mathematical treatment may follow once the definitions and relations are stable across the studies; this paper does not assume or require that treatment.

Quick Glossary

Term	Plain meaning
Existence (<i>astitva</i>)	In Madhyasth Darshan: beingness (<i>hona</i>) and indestructibility (<i>anashita</i>), always present as coexistence (<i>saha-astitva</i>).
Coexistence (<i>saha-astitva</i>)	Reality as the pervasive ground (<i>satta</i>) and all units (<i>ikai</i>) inseparably present together.
Time (<i>kaal</i>)	In Madhyasth Darshan: the duration of unit-activity (<i>kriya</i>), not an independent cosmic container; numerical reckoning of duration is a human convention within existence. Full treatment: Nature-Of-Time .
Satta (Omnipresence)	The all-pervasive, formless, non-transforming ground in which all units (<i>ikai</i>) are saturated (<i>samprikt</i>). Translation and naming conventions: Editorial Notes.
Saturation-Reflector Model	Sentience is not generated from dead matter; ever-present <i>gyan</i> of <i>satta</i> is expressed as active sentience (<i>chaitanya</i>) only when a constitutionally complete atom reaches a stable mediating configuration at <i>gathanpurnata</i> (the source texts call this a “reflector”). Full argument: §6.6.
Unit (<i>ikai</i>)	A countable, bounded entity in nature, whether insentient (<i>jada</i>) or sentient (<i>chaitanya</i>).
Jeevan (Sentient Self)	The sentient self: a real, immortal, constitutionally complete unit (<i>gathanpurna parmanu</i>) that works through the body (<i>shareer</i>).

Term	Plain meaning
Constitutional Completeness (<i>gathanpurnata</i>)	The first completeness stage: when a composite atom integrates the required number of nucleus and orbiting particles to become functionally indivisible, immortal, and sentient (<i>jeevan</i>). Threshold of Development Progression, not the final telos of existence.
Activity Completeness (<i>kriyapurnata</i>)	Restfulness of effort in the sentient atom; the knowledge-order stage of completeness (SB p. 58; MVD pp. 13–14, 27).
Conduct Completeness (<i>vyavaharpurnata</i>)	Destination of motion / authenticity of conduct in the sentient atom (SB p. 58; MVD pp. 13–14, 27).
Six Perspectives (<i>shaad-drishti</i>)	Six evaluative <i>drishti</i> provisioned in <i>jeevan</i> 's design: lower <i>priya/hita/labh</i> and humane <i>nyaya/dharma/satya</i> (MVD pp. 58, 60, 66–67). Full ethics treatment: Ethics-And-Morals-In-Human-Beings .
Sapekshata (Relativity)	In the knowledge order: relativity arising from <i>drishti</i> , <i>drishya</i> , and <i>darshan</i> — not unreality, and not a property of underlying coexistence. Full treatment: Knowledge, Knower, and Known §1.4.1.
Realisation in Omnipresence (<i>satta mein anubhav</i>)	Terminus of both progressions: coexistence evident in fulfilled relationships; not Omnipresence acquiring a new state (SB p. 51; MVD p. 116).
Realisation Knowledge (<i>anubhav jnan</i>)	Fundamental ontological given (MVD p. 11): saturated units and orderliness; distinct from <i>gyan udghatan</i> (awakened unfolding) and from the telos named above.
Awakening Progression (<i>jagriti-kram</i>)	Activation of higher provisioned <i>drishti</i> toward activity and conduct completeness in the knowledge order; distinct from Development Progression (<i>vikas-kram</i>) through the physicochemical complex to atomic constitutional completeness (MVD pp. 13–14, 27, 87).
Jada / Chaitanya	Insentient and sentient nature (<i>prakriti</i>).
The Four Orders (<i>chaar avastha</i>)	The real, stable developmental plateaus of nature in Madhyasth Darshan: Material (<i>padarth</i>), Pranic/Bio (<i>pran</i>), Animal (<i>jeev</i>), and Knowledge/Human (<i>gyan</i>).

Term	Plain meaning
Saturation (<i>samprikt</i>)	Ontological relationship between Omnipresence and every unit (soaked, submerged, surrounded): inherent energy and regulation in the unit through saturation; permeative <i>gyan</i> grounds orderliness in all units, active sentience at the constitutional-reflector threshold (§6.6); not physical extraction or depletion of <i>satta</i> .
Relationship (<i>sambandh</i>)	Definite mutuality between units where expectations are predetermined in the sense of completeness (MVD, p. 62); contrast association (<i>sampark</i>), where expectations are voluntary (MVD, p. 61).
Recognition and fulfilment (<i>pahchanna / nirvaha karna</i>)	Ontological activities in which a unit identifies its relationships and conducts itself so that value (<i>mulya</i>) flows in mutuality — universal across orders, explicit through evaluation in the knowledge order.
Capacity (<i>kshamata</i>)	Order-specific scope for participating in relationships and bearing what coexistence provisionally makes available (MVD, p. 62).
Ability (<i>yogyata</i>)	Competence to convert capacity into actual effort, conduct, or bonding (MVD, pp. 62, 79).
Receptivity (<i>patrata</i>)	Readiness for a relationship's expectations and values to register and flow; in humans, extent of receptivity is qualification (<i>arhta</i>) (MVD, pp. 62, 142).
Atman / Brahman	Advaita: the Self and the one ultimate reality, finally identical (§2).
Mithya	Advaita: dependent appearance of the empirical world (§2.1).
Sat-Chit-Ananda	Advaita: being, consciousness, bliss as three names of Brahman (§2.1; contrast §5.5).
Physicalism	Modern view: every real concrete phenomenon is physical (§3.1).
Panpsychism	Experientiality belongs, at least primitively, to fundamental reality (§3.3).
Strong / weak emergence	Strong emergence: a higher-level property that is not deducible from, and adds something to, its lower-level base. Weak emergence: a higher-level pattern fully fixed by its base. Relevant to §6.2 and §3.3.

Term	Plain meaning
Essentiality (<i>maulikta</i>)	How a unit's signature matters in mutuality — participation-as-value in relationships, measured by contribution to orderliness among the four orders (SB p. 50; MVD p. 125).
Unit signature	Inseparable four-tuple of form, properties, essential nature, and <i>dharma</i> carried by every saturated unit (MVD pp. 50–51).
Four planes	Physicochemical, delusional, deific, and divine (complete) planes — developmental stages spanning orders, mapped to three completeness transitions (SB pp. 51–52, 92).
Generative / degenerative / mediative	Property triad: effects that assist creation, dissolution, and sustainment in mutuality (MVD pp. 50–51).

1. The Madhyasth Darshan Answer

Madhyasth Darshan defines **existence** as the ever-present **coexistence** of formless **Omnipresence** and countless bounded **units of Nature** — beingness and indestructibility, beginningless and without creation from nothing.

Picture a beginningless universe with no first moment when ground or units arose from nothing. A formless, all-pervasive ground — Omnipresence — and countless bounded units of nature have always been inseparably present together. The ground does not act, transform, or wear out; every unit is soaked in it, surrounded and sustained through **saturation** (*sam-prikt*). Units are not isolated: each stands in definite **relationships** with others, recognizes those relationships, and fulfils them toward ever fuller completeness. Each unit carries inseparable form, properties, essential nature, and *dharma*, and participates in overall orderliness through that recognition and fulfilment.

All change is unit-activity — the single inseparable triad of effort, motion, and result (*shram-gati-parinam*) — oriented toward completeness provisioned in coexistence. Insentient nature develops through the physicochemical and biochemical complex — unit-and-environment together, not one atom in isolation — until an atom reaches **constitutional completeness** and becomes sentient **jeevan**, an immortal sentient self. That sentience threshold is irreversible; it is not yet humane awakening. Constitutionally complete *jeevan* in the human order can still mistake the body for the self and live from lower evaluative perspectives alone; **Awakening Progression** reorganizes conduct through higher perspectives toward activity and conduct completeness, until coexistence is evident in fulfilled relationships — **realisation in Omnipresence**, the telos of both progressions (SB, p. 51; §§1.4, 1.8).

Complementary units compose into larger assemblies, yet composition is not development: the real developmental plateaus are the **four ontological orders**. Nothing that exists is annihilated into absolute non-being; bodies and configurations begin and end while underlying reality persists through transformation. MVD compresses this ontology in *Brahma satya hai*,

jagat satat hai — Brahma is truth, the world is perpetual. What follows states the picture in the darshan's own terms, with textual support; comparative examination with Advaita, modern philosophy, and science belongs in later sections. The detailed orders–planes map with completeness transitions T1–T3 appears in §1.8.

Two progressions structure all change within this beginningless whole and must never be collapsed. **Development Progression** (*vikas-kram*) runs through the physicochemical and biochemical complex and culminates irreversibly when a developed atom reaches constitutional completeness (*gathanpurnata*) and becomes sentient *jeevan* (MVD, pp. 8, 14, 230; SB, pp. 13, 52; §1.5). **Awakening Progression** (*jagriti-kram*) matures that constitutionally complete *jeevan* toward activity and conduct completeness in humans (MVD, pp. 13–14, 27). Development is not awakening; composition is not development (§1.5).

The exposition below follows that arc from the ground inward: coexistential structure and unit signature, saturation, relationships and value, composition, change and time, the four orders and planes, *jeevan* and awakening, and conservation.

1.1 The Coexistential Structure: Space (*Satta*) and Nature

Existence is **co-eternally present** as two inseparable poles: formless Omnipresence and formful units of nature — neither made from the other, neither ontologically prior. Saturation is the ever-present relation in which they have always been together; what changes is unit activity, development, and awakening within coexistence. SB gives the most compressed formulation:

“What is evident is that consciousness and matter are inseparably present. Upon examining their fundamental nature, we learn that all of existence is essentially nature (matter) saturated in Omnipotence (consciousness). Here, ‘seeing’ is intended in the sense of understanding. Since nature saturated in Omnipotence is inseparably present, existence itself is eternally manifest in the form of coexistence.”

- SB, p. 48

Editorial note: The translation prints **Omnipotence** for *satta* at this point; this paper uses **Omnipresence** in analytical prose (Editorial Notes). The parenthetical “(consciousness)” labels the all-pervasive ground, not a personal knowing mind.

From this passage, *satta* and units are **co-eternally present** — matter and Omnipresence arise together, neither from the other, neither ontologically prior nor posterior. Saturation is the ever-present relation in which formless Omnipresence and formful units have always been inseparably together. What changes is the activity, development, and awakening of units within coexistence.

Realisation Knowledge (*anubhav jnan*) expresses this inseparable presentness:

“Sentient and insentient nature saturated in Omnipotence. The countless sentient and insentient units are saturated in Omnipotence (Omnipresence).”

- MVD, p. 11

“All units saturated in the Omnipresence (permeative and transparent) have form, properties, essential nature & dharma, and have inherent orderliness & participate in overall orderliness.”

- MVD, p. 11

Existence thus has two inseparable aspects:

1. **Omnipresence (Satta / Vyapak):** The formless, all-pervasive, non-transforming, immeasurable reality. It is described as actionless energy (*kriya-shunya urja*): it performs no actions, yet its permeative presence is the ground through which units are energized, regulated, and conserved in saturation.

“Omnipotence is not confined within any dimension of length or breadth, nor can any measure be established for it; therefore, Omnipotence is all-pervasive.”

- SB, p. 49

2. **Units of Nature:** The formful, active, countable, bounded entities — each with determinate reality, surrounded, submerged, and soaked in Omnipresence.

“Nature, saturated in Omnipotence, exists as countless units. Each unit, being saturated in Omnipotence, remains surrounded, submerged, and soaked in it.”

- SB, p. 48

Nature names the saturated whole of formful existence; **units** are the countable, bounded entities within it — each bounded from six directions yet inseparably present in coexistence (MVD, pp. 11, 34).

SB names this distinction explicitly: Omnipotence is *sthitipurn* (**state-complete**) — eternally present without motion, wave, or pressure — while nature saturated in it is *sthitishil* (**state-dynamic**): the countless units whose activity, development, and awakening constitute all change in existence (SB, pp. 50, 68–69). There is no place or time without formless existence; therefore *satta* does not progress. What progresses is unit-activity within saturation — completeness within saturation — until **realisation in Omnipresence**: not a new state of *satta*, but nature’s relationships fulfilled and evident in coexistence.

SB states the orientation of the whole in one sentence:

“The nature saturated in the state-complete Omnipotence is oriented for development and awakening until realisation in Omnipotence.”

- SB, p. 51

Realisation in Omnipresence here is the telos of both progressions — fulfilment evident in coexistence — not Omnipresence itself undergoing change. Development and awakening are the two legs of that orientation; neither substitutes for the terminus.

Naming these two aspects opens the question of their ontological relationship. What does it mean, in concrete terms, for a unit to be “saturated” in Omnipresence (*satta*)? Saturation is the ever-present bond of pervasive co-location between formless *satta* and each formful unit: the unit remains surrounded, submerged, and soaked in Omnipresence, and through that bond its inherent energy and regulatory order belong to the unit itself.

Causation, constitutional completeness, awakening, and conservation of reality belong to the arc that follows — from relationships and composition through change, orders, and *jeevan*.

1.2 Every Unit’s Four Inseparable Aspects

Every unit saturated in Omnipresence carries the same four inseparable aspects — form, properties, essential nature, and *dharma* — regardless of order. MVD states that all four orders have differentiating features related to these four (MVD, pp. 50–51). They are not optional descriptors added by a knower; they are what each unit **is** as a participant in coexistence.

Form (*roop*) is shared across all four orders. MVD defines it through shape, volume, and density — the physical attributes by which a bounded unit is individuated (MVD, pp. 50, 112).

Properties (*gun*) name the effects units have on one another in mutuality. In every order, properties are differentiated as **generative**, **degenerative**, and **mediative** — assisting creation, dissolution, and sustainment respectively (MVD, pp. 50–51). The relative powers that produce an effect when more than one entity come together are designated as properties; they are shared structural features of nature, not human classifications.

Essential nature (*svabhav* — Editorial Notes; not Buddhist *svabhava*) is how the usefulness of a unit’s properties participates in its order — the specific way a unit maintains balance among the four orders (MVD, pp. 50–51, 112). It differs by order; the cumulative pattern is summarised below.

Dharma names what a unit cannot be separated from — its innateness and fulfilment (SB, p. 50). Since existence is coexistence, indestructibility itself is the ultimate *dharma*; each order also carries a specific, cumulative *dharma* layered on the orders below it (MVD, p. 51).

Order	Essential nature (<i>svabhav</i>)	<i>Dharma</i> (cumulative)
Material (<i>padarth</i>)	integration–disintegration (<i>sangathan–vighatan</i>)	existence (<i>astitva</i>)
Bio (<i>pran</i>)	vitalising–devitalising (<i>sarak–marak</i>)	+ growth (<i>pushti</i>)
Animal (<i>jeev</i>)	cruel–uncruel	+ hope to live (<i>jeene ki aasha</i>)
Knowledge / human (<i>gyan</i>)	fortitude, courage, generosity, kindness, grace, compassion	+ happiness (<i>sukh</i>)

These four aspects are not a static catalog; they are how each unit **participates in mutual-ity** and thereby creates orderliness. SB opens its answer to duality-centred materialism with three companion facts:

“Each unit is a whole along with its environment.”

- SB, p. 13

“Each unit is orderliness with its ness and participates in overall orderliness.”

- SB, p. 13

“Each unit moves towards ‘development’ in its natural state and ‘decline’ in its excited state.”

- SB, p. 14

Wholeness is not aggregation alone: SB states **unit + environment = the unit as a whole**, which signifies its continuity (SB, p. 51). **Ness** names unit-kind (*tv*): the spontaneity in expression of being itself is *ness*, made evident through essential nature under naturalness (SB, p. 54). Essential nature (*svabhav*) is determined by the usefulness of a unit’s properties to the unit (MVD, p. 112): every unit is oriented toward creation, sustainment, or dissolution, and thereby toward development or decline. In each order the same signature executes differently — integration–disintegration in the material order, vitalising–devitalising in the bio order, cruel–uncruel in the animal order, fortitude and compassion in the knowledge order — as the table above summarises.

Dharma is what a unit cannot be separated from — the innateness of an entity (MVD, p. 112; SB, p. 50). Since existence is coexistence, indestructibility itself is the ultimate *dharma*; each higher order carries the *dharms* below it cumulatively (MVD, pp. 50–51). Those cumulative *dharms* are what **orderliness** expresses at each tier — activity completeness in the knowledge order appears as orderliness with *ness* (SB, pp. 51–52).

SB names the contrast between **natural state** — motion toward development — and **excited state** — motion toward decline; natural and excited states appear only in a unit’s mu-

tuality (SB, pp. 14–15). Assembly persistence under natural versus excited conditions is taken up with composition below.

MVD p. 11 names the same four-aspect structure for every saturated unit (quoted above, MVD, p. 11). Participation is not order imposed from outside: SB states that every unit of every order is seen participating in the overall orderliness, and that **participation means recognising and fulfilling** — a principle observable even in the physicochemical realm, where components within an atom recognise and fulfil one another, creating inherent orderliness in the atom (SB, p. 123). MVD ties *svabhav* to mutuality directly: the usage of every property is solely for creation, sustainment, or dissolution; therefore the essential nature of every unit presents as creation-oriented, sustainment-oriented, or dissolution-oriented activity toward development or decline (MVD, p. 112). Endeavour aligned with this innateness is exuberance and leads to resolution; endeavour against it is retrogression and gives rise to problems (MVD, p. 112).

The signature therefore **is** the unit's share in mutual order — not a label pasted onto inert stuff. JV illustrates this with definite conduct: a peepal tree maintains its definite conduct with all its fruits, seeds, and leaves exhibiting peepal's properties, intrinsic nature, and *dharma*; the plant and animal worlds each exhibit their respective definite conducts — this is inherent orderliness (JV, p. 113). How that participation registers as essentiality and value in relationships is the next layer of coexistence; here the point is structural: form, properties, essential nature, and *dharma* are the inseparable terms in which each unit abides in orderliness and participates in the whole.

Harmony among form, properties, essential nature, and *dharma* is what MVD calls the essence of coexistence itself (MVD, p. 21). A compound assembly inherits a new signature at each tier when units compose; the four-aspect template therefore iterates with every genuine new unit.

Change within coexistence — how *satta* relates to unit-activity without being the efficient cause of particular change — is the subject of the section on causation, motion, and time.

1.3 Saturation: The Ground–Unit Bond

The source describes units as soaked, submerged, and surrounded — *samprikt* — in Omnipresence. Madhyasth Darshan treats saturation as an **ontological relationship**: pervasive co-location — the ever-present bond between formless Omnipresence and formful units, and the first layer of relational structure in coexistence. It is not a physical drawing, extraction, or depletion of energy from *satta*; Omnipresence does not act, transform, or be consumed in saturating a unit.

One way to picture the bond — **illustrative, not identity** — is a living cell in nutrient medium, or a sponge fully soaked in water: the unit remains surrounded, permeated, and sustained **through** the medium, not drained from a finite store that depletes as saturation proceeds. The parallel captures co-location and mutual presence, not the darshan's full

claim: *satta* is actionless (*kriya-shunya*), non-transforming, and not a physical substance that acts on units (§4.3).

Through this relationship, every unit has **inherent energy** and regulatory order **in** it — energy fullness is of the saturated unit because of saturation, not a separate quantity transferred from a store. SB states this plainly:

“Every unit in its atomic state is active as orderliness, because it has inherent energy due to being saturated in Omnipotence.”

- SB, p. 69

“Unit + Energy fullness = Activeness.”

- SB, p. 69

SB and MVD state the reciprocal structure of manifestation directly:

“Thus, without basic impulsion, the energy remains unmanifest, and without the energy, there is no basic impulsion.”

- SB, p. 62

“Without absolute energy, there is no basic impulsion in matter, and without matter, absolute energy is not revealed. Nature is eternally present in absolute energy.”

- MVD, p. 40

This paper uses **mutual dependence for manifestation** as shorthand for that reciprocal structure — not one-way supply from Omnipresence to units. In coexistence, uniform energy at the ground and unit-activity manifest together: without unit activity the energy remains unmanifest; without saturation, there is no basic impulsion (SB, p. 62; MVD, p. 40). *Satta* remains formless, motionless, and free from pressure, while the whole of nature saturated in it is present with motion and pressure (SB, p. 49). Regulation, activeness, and forcefulness in a unit are **read from** its being surrounded, submerged, and soaked in Omnipresence (SB, p. 57) — not injected as efficient cause. Saturation names that relation: Omnipresence as ground and every unit of nature as participant — co-eternally present, each real in its own right, with *satta* as supreme cause in the sustaining sense rather than as the trigger of particular change.

Before SB compresses this structure into an identity-chain, three activity terms need plain anchors. **Basic impulsion** is the unit’s inherent drive to be active given saturation — not an external push from the ground. **Forcefulness** and **activeness** name how uniform ground-energy reads as activity **in** the saturated unit (SB, pp. 57, 62, 69). **Effort–motion–result** is the single activity triad in which all change appears — effort, motion, and result as inseparable aspects of one activity, developed fully in §1.6.

Tiered intelligibility. All saturated units participate in inherent orderliness — the intelligibility-ground of *gyan* as *satta*, not an act of cognition by Omnipresence. Insentient units ex-

hibit radiance and projection (SB, p. 69); at constitutional completeness, when a stable atom-configuration is reached, that configuration acts as a **mediating configuration** through which ever-present *gyan* manifests as active sentience — the Saturation-Reflector Model (§6.6). That ontological register is distinct from the projection–reflection cycle in *jeevan*.

Omnipresence is called energy and credited with energizing, regulating, and conserving nature, yet is also called actionless (*kriya-shunya*) and non-transforming. The texts resolve this by distributing the terms: *satta* is actionless in itself, but its energy is manifest as the activity of units through basic impulsion — latent, uniform energy at the root of activity, never acting on its own, yet inseparable from the activity through which alone it is revealed.

SB summarises the reciprocal structure as a continuous identity-chain — a characteristic Madhyasth Darshan reasoning pattern in which each link is an identity (“itself is”), not an external push:

“Saturation in uniform energy itself is forcefulness, forcefulness itself is basic impulsion, basic impulsion itself is activity, activity itself is effort-motion-result, effort-motion-result itself is development and its continuity.”

- SB, p. 62

Read as a single logical structure — each step names the English idea first, then the term the texts compress:

1. Saturation in uniform energy = forcefulness (how ground-energy reads as activity **in** the unit).
2. Forcefulness = basic impulsion (the unit’s inherent drive to be active given saturation).
3. Basic impulsion = activity (unit-activity as such).
4. Activity = effort–motion–result (*shram–gati–parinam*) — the single activity triad developed in §1.6.
5. Effort–motion–result = development and its continuity.

Each link is identity, not efficient causation from *satta*. Uniform energy becomes forcefulness only through the unit, activity only through basic impulsion, development only through effort–motion–result — the single activity triad that structures all change in coexistence.

1.4 Relationships, Recognition, and Value in Mutuality

Saturation names the ontological relation between Omnipresence and every unit. Existence also contains a second layer of **ontological relations between units**. Nothing in nature is isolated — “nothing is isolated – that is the principle” (JV, p. 43). Each unit stands in definite relationships with other units. MVD defines a **relationship** as “the mutuality where expectations are predetermined in the sense of completeness” (MVD, p. 62), and contrasts it with **association**, “the mutuality where expectations are voluntary” (MVD, p. 61). Both are real;

the structural template of coexistence runs through predetermined relationships whose expectations are fixed by order and signature, not chosen ad hoc.

Because existence is coexistence, SB states that entire beingness exhibits “complementarity, mutual recognition, and impression in their mutuality, manifesting in the form of reciprocity” (SB, p. 50). **Essentiality** in every plane and order is **value**:

“Entire beingness implies the essentiality of units in every plane and order. Essentiality refers to value... It is values that are reciprocated and mutually recognised, as complementarity, mutual recognition, and impression occur only in mutuality.”

- SB, p. 50

MVD states the same chain in another register: sentiment is essentiality — the meaning of a unit’s essential nature and *dharma* in its order or plane — and essentiality is value, responsibility and participation, outcome, and evaluation (MVD, p. 125). Essentiality is therefore how a unit’s four-aspect signature **matters in mutuality**: the degree to which it participates in maintaining orderliness and harmony among the four orders, not a moral invention layered onto a value-free nature. MVD p. 11 already names this participation as inherent in every unit saturated in Omnipresence; SB p. 50 adds that essentiality is regulated and protected because it is eternally present.

Values are the content exchanged when relationships are recognised and fulfilled. Complementarity and orderliness are the structural forms this mutuality takes (SB, p. 49).

Every unit **recognises** its relationships and **fulfils** them through **capacity**, **ability**, and **receptivity** at the level of its order. JV states this universally:

“Every entity of nature recognises another; that is why it fulfils. An atomic particle too recognises another, and as a result, these particles abide in orderliness. They cohabit and function with one another, thus manifesting coexistence. Similarly, starting from molecules to planets, the entities of nature recognise one another and fulfil accordingly.”

- JV, p. 69

Recognition and fulfilment are therefore ontological activities, not optional moral add-ons. In the material order they appear as structural conformity; in the biological order as seed conformity; in the animal order as species conformity; in the knowledge order they pass through knowing, believing, evaluation, and choice (JV, p. 48; MVD, p. 77). The same cycle becomes explicit in humans as knowing → believing → recognizing → fulfilling ([Knowledge, Knower, and Known](#) §1.5).

SB traces why that orientation is built in: nature saturated in state-complete Omnipotence is **embedded in the complete** — it inherently contains the directionality of completeness — so every unit is compulsorily meant for completeness and it is natural for every unit to be ori-

ented toward development (SB, pp. 50–51). Each unit embedded in the complete is active and developing solely for completeness (SB, p. 51).

The **completeness drive** (SB, p. 51) is the orientation of unit-activity toward fulfilling these relationships at ever higher stages — constitutional, activity, and conduct completeness — until realisation in Omnipresence. Constitutional, activity, and conduct completeness are **stages along** that telos, not substitutes for it. Units do not maximise an abstract quantity; they move toward terminal satisfaction through recognising and fulfilling the relationships provisioned in coexistence. Constitutional completeness itself is “the process... disciplined and bounded by the law of recognising and fulfilling among multiple parts” (MVD, p. 77) — constitution is relational before it is sentient.

MVD names the three **intellectual means** (*bauddhik sadhan*) through which that fulfilment operates: capacity, ability, and receptivity (MVD, p. 62). Where content is available but humane perspective is lacking, MVD names **grace** (*krupa*) as the endeavour of instilling receptivity (MVD, p. 61). The triad is not a psychological mood but the order-specific mechanism by which relationship-recognition becomes explicit conduct — definite in the first three orders, achieved through awakening in humans.

Three levels of recognition–fulfilment should be kept apart within this single ontological thread. **Structural** recognition–fulfilment — complementarity and mutual recognition eternally established (SB, p. 49) — belongs to every order. **Constitutional** recognition–fulfilment defines *gathan* among multiple parts (MVD, p. 77). **Evaluative** perspective in the knowledge order uses six provisioned *drishti*. Humane conduct and ethics are not a separate domain glued onto ontology; they are how relationship-recognition and value-fulfilment appear once *jeevan* evaluates and chooses.

In the first three orders, units do not choose conduct the way deluded humans do. Insentient units lack the thought aspect; their field of activity is limited to length, width, and height (MVD, p. 77). JV states that structural conformity regulates the material order, seed conformity the biological order, and species conformity the animal order — and that every unit of nature except humans exhibits definite conduct (JV, pp. 48, 113). MVD contrasts animal-order *jeevan*, dependent both while performing actions and while experiencing consequences (MVD, p. 69), with humans, for whom knowing and believing — evaluation — are activities of the knowledge order alone (JV, p. 70).

Madhyasth Darshan treats relationship-fulfilment as modulated by three factors named together as **intellectual means** (*bauddhik sadhan*):

Intellectual means (*bauddhik sadhan*): *The intellectual means are in the form of capacity, ability and receptivity.*
- MVD, p. 62

Capacity (*kshamata*) names what a unit can bear or perform at its order — the provisioned scope for participating in a relationship. **Ability** (*yogyata*) names what it can convert into actual activity. **Receptivity** (*patrata*) names whether the relationship’s expectations and

values can register and flow. Together the three form a single mechanism: capacity sets the scope, ability converts that scope into effort (*shram*), and receptivity determines whether the relationship's values actually register and fulfilment (*nirvaha*) can complete. **Fulfilment** is defined as evidencing use, right-use, and purposeful-use together with resolution and prosperity, or proving mutually complementary (MVD, p. 62) — which requires all three factors, not receptivity alone. **Means** (*sadhan*) combines the necessary resources with receptivity for the seeker (MVD, p. 62). In the knowledge order, the extent of receptivity constitutes qualification (*arhta*); qualification, perspective, and worldview unfold through study and environment in *jeevan*'s awakening progression.

The triad is not confined to the knowledge order. MVD states that **ascending** (*agreshan*) is the balance and receptivity gained while converting capacity and ability into effort, while **frustration** (*kshobh*) is the shortcoming in that conversion — “incompleteness of receptivity” (MVD, p. 79). Particles in the outermost orbits of insentient atoms are active through effort, engaged in compounding activities that advance toward the biological order (MVD, p. 79). At the atomic tier, development-progression operates “in the form of hungry and overfull atoms” (MVD, p. 8): an atom deficient in particles bonds with one bearing excess because needs and surpluses are complementary. Even atomic bonding is relationship-recognition converting capacity and ability into effort at the level receptivity allows.

In the knowledge order, “the movement towards awakening or decline depends solely on this capacity, ability, and receptivity” (MVD, p. 134). In lower orders the three operate definitely; in humans they must be achieved while relationships pass through evaluation and choice. When complementary units fulfil their relationships, they compose into larger units.

1.5 Composition and Assemblies

When complementary units fulfil their relationships, they **compose** into larger units. JV states the engine:

“Everywhere, there exists a natural inclination towards coexistence. This inclination is what leads atomic particles to assemble into atoms, atoms to combine into molecules, and molecules to combine into molecular forms.”

- JV, p. 67

MVD distinguishes two modes of composition (MVD, p. 42). In a **mixture** (*mishran*), components all maintain their respective conducts — aggregation without a new joint conduct. In a **compound** (*yaugik*), components combine in definite proportion, discard their own conducts, and present another kind of conduct — a genuinely new unit with its own form, properties, essential nature, and *dharma*. Only compound composition creates a new tier of the hierarchy.

SB insists that **composition is not development**. A composition never exceeds its constituents in essential “-ness” (*tv*): the largest iron structure is neither more nor less than

ironness; species nature in the material, biological, and animal orders remains definite through result-, seed-, or species-conformance (SB, pp. 75–76). Assemblies aggregate or compound; they may resemble growth, but the developmental plateau is crossed only when an **atom** reaches constitutional completeness. Humans alone can deviate from humanness while claiming superiority — which is why knowledge-order progress requires awakening through evaluation, not mere enlargement of composition.

Because the output of composition is itself a unit, the same relational template iterates. In the **material line**, particles compose into atoms, atoms into molecules, molecules into molecular structures — “this Earth and every other planet are compositions of atoms and molecules” (MVD, p. 8). In the **biological line**, “The coexistence of one cell (*pran kosha*) with another cell leads to multicellular forms, resulting in the formation of definite organisms” (JV, p. 82). In the **animal line**, bodies are composed of biological cells and lineage carries species-conformance across generations (MVD, p. 79; JV, p. 48). In the **knowledge line**, “More than one human coming together or becoming organised is referred to as a family, community, or undivided society” (MVD, p. 55) — extending toward universal orderliness. Each tier is both a completed assembly and a participant in the next.

An assembly **persists** while its internal and external relationships are fulfilled within conducive conditions — its natural state — and **declines or decomposes** when they are not — its excited state (SB, p. 14). Every persisting assembly transmits its method of composition (*rachna vidhi*) across generations of its members: by constitution in the material order, by seed in the biological order, by lineage and species in the animal order, and by education-*sanskara* in the knowledge order (JV, pp. 48, 82; MVD, pp. 92–93). In the first three orders, composition, persistence, and transmission operate definitely; in the knowledge order they must pass through understanding, evaluation, and choice — which is why human assembly above the individual is the only tier that can fail and the only one still incomplete (JV, p. 47). Formal articulation across all orders: [The Coexistence Template](#). How composed units change — and how time belongs to that activity — is the subject of the next section.

1.6 Change Within Coexistence: Causation, Motion, and Time

Madhyasth Darshan distinguishes **origination** (units co-eternally present in coexistence) from **causation** (what produces change when units transform). Unit-activity runs toward constitutional, activity, and conduct completeness; this section states **how** that activity — already structured as the single principle of effort, motion, and result (*shram-gati-parinam*) — is causally formed.

Change within coexistence is worked by units themselves. Omnipresence grounds and conserves all units through saturation as **supreme cause** (*mahakaran*) in the sustaining sense — the ground of activity, not its trigger. MVD presents a four-level causal hierarchy before naming *satta* as *mahakaran*:

Gross (*sthool*) → Subtle (*sukshma*) → Causal (*atma in jeevan*) → Supreme cause (*vyapak / satta*)

1. **Gross (*sthool*):** bodies or objects constituted of many atoms.
2. **Subtle (*sukshma*):** atoms themselves.
3. **Causal (*karan*):** *atma* (within *jeevan*).
4. **Supreme cause (*mahakaran*):** Omnipresence (*vyapak*).

“An object or body constituted of many atoms is referred to as ‘gross’. Atoms are referred to as ‘subtle’. Atma is referred to as ‘causal’. [Omnipresence] is referred to as ‘supreme cause’.”

- MVD, pp. 288–289

Satta is the supreme cause in the sense of the sustaining ground — not the trigger of any particular transformation (MVD, p. 289; SB, pp. 49, 62). The causal work of change is done by units themselves.

MVD also summarises three ontological *dharma*s at this level (p. 288): the insentient is mortal (*maran-dharma*), the sentient is immortal, and Omnipresence is eternal. Mortality here does not mean annihilation — coexistence conserves *vastu* through transformation — but marks that insentient units lack *jeevan*’s constitutional immortality.

Among the **Fundamental Concepts** on MVD p. 11, Realisation Knowledge (*anubhav jnan*) and the principle of **effort, motion, and result** (*shram-gati-parinam*) appear as the third and fourth entries. All activity in nature — insentient and sentient — carries this single irreducible triad, formulated as:

“Every physical-chemical activity is an inseparable presence of effort, motion and result. Each of these is a joint form of the other two.”

- SB, p. 58

Effort, motion, and result are not three sequential steps but three inseparable aspects of the same activity, each implying the other two. Consider sodium and chlorine ions approaching one another: the approach is effort and motion together; the stable salt crystal is result — yet none of the three occurs without the others, and after reciprocal exchange both parties attain satisfaction or natural motion (*svabhav gati*), cyclical restoration to natural state rather than one-way extraction (SB, pp. 52–53). The same triad read differently in a human facing unresolved conflict: effort toward understanding, motion through deliberation, result as resolution (*samadhan*) oriented toward activity and conduct completeness — not a second principle, but the sentient register of the same inseparable activity.

Because nature is eternally active, every interaction carries this triad. Two structural patterns follow in the insentient orders — both expressions of **inter-unit relationships**:

- **State and motion are inseparable:** there is force in state, power in motion (SB, pp. 248–249).

- **Give–take complementarity**: after reciprocal exchange, both parties attain satisfaction or **natural motion** (*svabhav gati*) — cyclical restoration to natural state, not one-way extraction (SB, pp. 52–53).

Change in the insentient orders is therefore always circular and conserved, never one-way or annihilating.

“Nature, embedded in Omnipotence, is naturally inclined towards development until the realisation of Omnipotence.”

- SB, p. 70

That inclination is not a separate force alongside effort–motion–result; it is how embedded-in-complete nature expresses itself through unit activity. **Mediative activity** — the hidden energy that normalises generative and degenerative charge in mutuality — continuously works toward equilibrium because its aim is completeness (SB, p. 70). This is the insentient-order engine of the completeness drive (§1.4): atoms bond, compose, and integrate particles toward constitutional completeness through mediative activity within the same triad. Awakening progression is the knowledge-order leg named alongside development in the full telos at SB p. 51; it enters only after T1, when constitutionally complete *jeevan* can evaluate and choose (§1.8–§1.9).

In the sentient atom, the **same** triad continues:

“Effort, motion, and result continue to occur within evolving-constitution atoms. Even upon attaining immortality, there is no lack of effort in the activity of ‘jeevan’.”

- MVD, p. 78

What differs is not a second triad but how the three legs are read toward completeness. In the sentient atom (SB, p. 58):

- result (*parinam*) → constitutional completeness — immortality of result;
- effort (*shram*) → activity completeness — restfulness of effort;
- motion (*gati*) → conduct completeness — destination of motion.

SB p. 71 states this teleology for every developing atom: result oriented toward immortality, effort toward restfulness, motion toward destination. After constitutional completeness (*gathanpurnata*), the constitutionally complete atom undergoes **qualitative change without quantitative change** in particle count (SB, p. 55) — not physicochemical transformation in the material sense, but the triad remains.

Sentient nature adds projection and reflection: insentient units are radiance and projection only; sentient nature adds reflection toward **resolution** (*samadhan*) in the knowledge order (SB, pp. 60, 64–65, 69). The five-faculty table and full projection–reflection cycle are developed in §1.9.1.

Order-specific mutual activity under the same triad differs: image and effect in material nature; evaluation of essential nature in the animal order; exchange of values and evaluation of *dharma* as evaluation of resolution in humans (SB, pp. 248–249).

Time in Madhyasth Darshan is the **duration of unit-activity** — inseparable from the motion and effort–motion–result cycles of active units, not a freestanding cosmic container alongside *satta* and units. Where there is no transforming activity in formless, actionless Omnipresence, there is no time in this sense. Comparative treatment of *trikaalabadh*, numerical reckoning, past–present–future structure, and spacetime physics belongs in [Nature-Of-Time](#).

Circular causation is how completeness-directed activity appears across orders: not maximisation, but definite movement through the single triad and its sentient unfolding where *jeevan* is active. Change within coexistence runs through this highly ordered, realist structure of nature — not an amorphous mass. That structure also implies **conservation**: units transform configuration (*roopantaran*) but underlying *vastu* is never annihilated from absolute non-existence (*abhava*). Whether existence itself begins, and what follows for *jeevan* across death, is argued in the section on conservation.

1.7 The Four Ontological Orders

Nature exists as countless physical and sentient units — organised, bounded, and active within Omnipresence. Madhyasth Darshan names four **ontological orders** — material, pranic/bio, animal, and knowledge/human — each a stable plateau in development. The order table in the section on unit signature gives each order’s essential nature and cumulative *dharma*; what follows states how the orders relate.

“Existence is not just physicochemical matter, but all physical, chemical and jeevan entities are inseparably present in Omnipresence.”

- MVD, p. 5

This is why the human being is understood as a joint form of a physical body (*shareer*) and a sentient self (*jeevan*):

“Brahma (Omnipotence) is omnipresent, and jeevan-clouds are many.”

- MVD, p. 13

“The grandeur of humans as a joint form of jeevan and body.”

- MVD, p. 13

Nature is organized into four real, objective **Ontological Orders** (*chaar avastha*) — material (*padarth*), pranic/bio (*pran*), animal (*jeev*), and knowledge/human (*gyan*). Each is a stable plateau in development; its form, properties, essential nature, and cumulative *dharma* are given in the order table above. Higher orders **include** the *dharma*s of lower orders cumulatively (SB, p. 179; MVD, p. 115). In the knowledge order, existence and growth are evi-

dent in the human body; *sanskar* and happiness must become meaningful in *jeevan* (SB, p. 179).

The four orders are cumulative in *dharma* but not equally stable as compositions. SB notes that the biological order appears more developed than the material yet is **less stable and less diverse** — it can revert to the material order after manifesting its essentiality — whereas irreversible atomic development crosses only at constitutional completeness (SB, pp. 76–78). SB p. 77 reads the emergence of biological and animal orders on Earth as serving the **knowledge order** — non-human nature provisioned as a ladder toward humans who can realise coexistence in behaviour through awakening. That is Madhyasth Darshan’s **teleological reading** of order-progression within completeness, not a neutral claim of evolutionary biology: modern ecology does not require cosmic anthropocentrism, and the texts’ ladder language should be read as order-specific developmental narrative within the darshan rather than as an independent scientific theorem.

Teleology in Madhyasth Darshan operates at two levels that should not be conflated. **Metaphysical teleology** is built into the ontology: units are oriented toward completeness provisioned in coexistence; effort–motion–result is read toward constitutional, activity, and conduct completeness (§1.6); destiny as orderliness (*niyati*) names definite orientation toward that completeness, not fatalism imposed from outside (§1.8). That completeness-drive is a structural commitment of the system — what it means for nature to be active within saturation. **Expository teleology** is order-specific narrative: SB’s ladder from bio and animal orders toward knowledge-order realization on Earth (SB p. 77) is developmental framing within the darshan, not a theorem of evolutionary biology. Physicalism carries no teleology at either level; the comparison stake for §5.2 and §5.8 is whether Madhyasth Darshan’s metaphysical orientation toward completeness is an ontological posit or merely pedagogical language — this paper treats it as the former in §1.6–1.8 while isolating the ladder passage as the latter.

These are **objective categories in nature**, not human typologies: material atoms, living cells, animal organisms, and knowledge-order humans each occupy a real plateau whose layered *dharma* is fixed by the order itself. In the animal order, *jeevan* is influenced by **inertial-impression** (*adhyasa*) — species-traditional activity patterns accepted from gestation and emulated after birth — whereas humans in the knowledge order recognize through *sanskar*-conformity (SB, pp. 62–63; JV, p. 48). This *adhyasa* names species-traditional conduct, not Advaita’s ontological superimposition of the world on Brahman (§5.7). Each order also cyclically manifests through saturation in *satta*, but in a different mode (MVD, p. 289):

Order	Cyclical manifestation through saturation
Material (<i>padarth</i>)	Units are active because of being in Omnipresence
Bio (<i>pran</i>)	Units have pulsation because of being in it
Animal (<i>jeev</i>)	Units have the hope of living because of being in it

Order	Cyclical manifestation through saturation
Knowledge / Human (<i>gyan</i>)	Units are hopeful and conscientious because of being in it

Cyclicality is real at every order, but not by one identical mechanism — the circular structures of effort–motion–result and give–take complementarity run through all orders; the table names what distinguishes each order.

For readers approaching from neuroscience, Bhattacharya maps how *jeevan* relates to brain and order (material and biological entities without brain; brain-endowed organisms sometimes without *jeevan*; *jeevan*’s activity mediated through the brain in the knowledge order) — **Bhattacharya**, *The Relationship of Jeevan and Brain*; see also [Why-Humans-Are-Not-Just-Material](#).

These four orders are where development without creation from nothing becomes concrete. Planes, constitutional completeness, and the emergence of *jeevan* are traced in the next section. Each order is a real, stable plateau that the next presupposes, so the upward movement from matter to human is development within coexistence, not the appearance of new substance.

SB p. 49 pairs immeasurable pervasion with practical uncountability in characteristic Madhyasth Darshan parallelism: *satta* is immeasurable by pervasion; *prakriti* is countless because no finite count can complete:

“Omnipotence is not confined within any dimension of length or breadth, nor can any measure be established for it; therefore, Omnipotence is all-pervasive. All the units that exist in the form of nature cannot be counted; therefore, they are countless. In this way, existence itself is omnipresent and countless.”

- SB, p. 49

Countless here means **practical uncountability**: nature’s units are too numerous for any finite count to complete, not a claim that the plurality is mathematically infinite. That reading fits the treatise’s **countable, bounded units** and definite relationships — real particulars, indefinitely many from any finite standpoint. Conservation is therefore asserted of **each** existing *vastu* through configuration change, not as a global total over all units (§1.10, §6.2.3).

1.8 Planes and the Emergence of *Jeevan*

Development within saturation is oriented toward completeness — and, in SB’s full formulation, toward **development and awakening until realisation in Omnipresence** (SB, p. 51). **Development Progression** (to T1) and **Awakening Progression** (T2–T3) are two legs of one orientation, not two unrelated stories; both advance the completeness drive traced in §1.4. MVD’s Postulations state that **physicochemical nature itself** is in develop-

ment progression and that the atom in developed form is the sentient unit (MVD, p. 14). That progression is manifest as the ceaseless diversity of the **physicochemical plane** (SB, pp. 52–53): hungry and overfull atoms, molecules, and biological cells in mutual composition; on Earth, chemical reactions and biological processes advancing through unit-and-environment (MVD, pp. 8, 13; SB, p. 13). This section traces **Development Progression** through the complex to T1; awakening milestones within constitutionally complete *jeevan* belong to the account of *jeevan* that follows.

Madhyasth Darshan names three completeness stages — constitutional, activity, and conduct. In the sentient atom, constitutional completeness is immortality of result; activity completeness is restfulness of effort; conduct completeness is destination of motion (SB, p. 58). Constitutional completeness marks the *jeevan* threshold and animal-order hope of living; activity and conduct completeness are milestones within constitutionally complete *jeevan* in the knowledge order.

Progress never isolates a unit from its field. SB states the continuity of law within every unit as **unit + environment = the unit as a whole**, which itself signifies its continuity (SB, p. 51). Regulation and magnificence appear because each unit is always unit-and-environment together; the completeness drive runs through mutual relationships provisioned in coexistence, not through solitary self-transformation.

As stated at the opening of §1, two paths carry this drive and must not be collapsed: **Development Progression** through constitutional completeness (traced below) and **Awakening Progression** within constitutionally complete *jeevan* (§1.9). SB presents the orientation of the whole as an identity-chain: existence itself is development, development itself is progression, progression itself is orderliness, and orderliness itself is destiny (SB, p. 56). **Destiny** (*niyati*) here is not fatalism imposed from outside: it is the definite orientation of every unit toward completeness already provisioned in coexistence. Orderliness is what mutuality is when units recognise and fulfil.

Alongside the four **orders** named above — objective plateaus fixed by the kind of unit — SB names four **planes** (*pad*): developmental stages in nature's progression toward completeness (SB, p. 52). An order names what a unit **is**; a plane names where development has reached in the history of nature saturated in Omnipresence. Some planes span more than one order; in the knowledge order, plane membership tracks **human state** (deluded, awakened, evidenced) rather than a new insentient plateau.

SB lists the four planes as the physicochemical plane, delusional plane, deific plane, and liberation from planes — also called the divine or complete plane (SB, p. 52). In oral exposition these are sometimes called the Pranic, delusion, deific, and divine planes; the Pranic label maps to SB’s **physicochemical plane**, which comprises the material and biological orders.

The first completeness stage is also the first **plane transition** (SB, pp. 51–52):

Transition	Completeness stage	From → to	What becomes evident
T1	Constitutional completeness (<i>gathanpurnata</i>)	Physicochemical → delusional	Sentient <i>jeevan</i> ; animal order and deluded knowledge-order humans; hope to live

T1 is **irreversible** at the atomic level: the insentient atom develops into sentient status and does not revert to insentience for any reason (SB, p. 92). That threshold exits the physicochemical plane — the first stage of development in nature’s progression toward completeness. T2 and T3 — activity and conduct completeness as transitions to the deific and divine planes — are awakening milestones within constitutionally complete *jeevan* in the knowledge order; in humans they appear as reorganized conduct (*aacharan*) and resolution (*samadhan*), the lived face of completeness rather than a separate domain from ontology.

SB notes that all stages observed in the progression of emergence — physicochemical, delusional, deific, and divine planes — are marked by the activity of both insentient and sentient nature (SB, p. 92).

SB names the atom the fundamental unit of nature because development **culminates** in the atom — yet the path runs through the wider physicochemical complex. Molecules exhibit characteristics of development but not **actual** development; the irreversible sentient threshold is constitutional completeness of the atom (SB, p. 52; §1.5). Madhyasth Darshan gives a developmental account of how an insentient atom (*parmanu*) — always a **composite** of nu-

cleus and orbiting particles, not an elementary particle of physics (MVD, p. 42) — reaches *gathanpurnata* within that complex: particle incorporation and expulsion between atoms, hungry and overfull complementarity, and environmental mutuality (MVD, p. 8; SB, pp. 58, 71). When the required number of particles for its constitution are all integrated, the atom becomes constitutionally complete: satisfaction within, by, and for that constitution — the immortality of the result, and the attainment of sentient status (SB, p. 59). All types of atoms, including constitutionally complete ones, are eternally present through the natural law of co-existence in existence (SB, p. 59).

In this state of completeness, there is neither an increase nor a decrease in the number of particles in the atom; due to this stability, the constitutionally complete atom possesses inexhaustible power and force and undergoes qualitative change without any quantitative change (SB, p. 55). Constitutional completeness is achieved through particle incorporation and expulsion between atoms, not only monotonic addition (SB, pp. 58, 71). Qualitative change without quantitative change in the sentient atom “persists from delusion till awakening” — the transition marks a stable sentient threshold, not a claim that every downstream conduct state is irreversible.

MVD states that the fundamental unit is the insentient atom, which through development attains sentience as evidence of constitutional completeness; upon achieving it, its endeavour is toward activity completeness (MVD, p. 76). A constitutionally complete atom does not revert to insentience in constitution (SB, pp. 55, 59, 92). Constitutional completeness is therefore the ontological threshold at which an atom becomes *jeevan* — sentient, immortal in constitution, and oriented toward further completeness through activity and conduct, and ultimately toward **realisation in Omnipresence** as the third completeness stage and telos of both progressions (SB, p. 51). The structure of *jeevan*, its provisioned perspectives, and awakening progression are developed below.

1.9 *Jeevan*: Structure, Perspectives, and Awakening

The sections above traced Development Progression to constitutional completeness and named the four planes. What follows concentrates on *jeevan* — the sentient self that works through the body (*shareer*) — its projection–reflection cycle, the six evaluative perspectives (*shaad-drishti*), and Awakening Progression through activity and conduct completeness. Quick Glossary rows on *jeevan*, the four planes, and the six perspectives supply compressed definitions; here the aim is structure and ontological placement, not the full behavioural treatment in [Ethics-And-Morals-In-Human-Beings](#) and [Human Behavior and Society](#).

As the constitutionally complete unit whose threshold was traced above, *jeevan* is the sentient self that works through the body (*shareer*) in the animal and knowledge orders. In plane terms, animal-order *jeevan* and deluded knowledge-order humans occupy the delusional plane; awakening progression moves a human through the deific plane toward conduct completeness and evidence in the divine plane.

1.9.1 Structure and the projection–reflection cycle

MVD lists five inseparable aspects — *mun*, *vritti*, *chitta*, *buddhi*, and *atma* — within the *jeevan*-cloud (MVD, p. 13). MVD holds that *atma*, *buddhi*, *chitta*, *vritti*, and *mun* are indivisible in a *jeevan*-cloud; energies channel toward development and awakening through them — curiosity, enthusiasm, delight, immersion, and finally realization (MVD, p. 77). The five faculties belong to the same *jeevan*-cloud (MVD, p. 83); every sentient unit is endowed with perspective (MVD, p. 84). They operate through the projection and reflection cycle (*paravartan* and *pratyavartan*), previewed in §1.6:

Strength / power	Projection (<i>paravartan</i>)	Reflection (<i>pratyavartan</i>)
<i>Mun</i> / hope	selection	taste (<i>asvad</i>)
<i>Vritti</i> / thought	analysis	deliberation
<i>Chitta</i> / desire	visualisation	contemplation
<i>Buddhi</i>	resolve (<i>sankalp</i>)	enlightenment (<i>bodh</i>)
<i>Atma</i>	authenticity (<i>pramanikta</i>)	realisation (<i>anubhav</i>)

In delusion, hope follows sensation upward from the body; in awakening, realisation in coexistence at *atma* regulates *buddhi*, *chitta*, *vritti*, and *mun* through the same projection–reflection cycle (MVD, Ch. 17, pp. 274–277). When lower faculties do not take refuge in the one above, the texts call this *bauddhik rahasya* (intellectual mystery) — not an ontological opacity in coexistence, but misalignment within *jeevan* (MVD, Ch. 17, p. 279). Why development and decline can look equally mysterious uses the same structure: the means are shared; only the direction of the cycle differs (MVD, Ch. 17, pp. 295–296). For the full-knowability thesis, see [Knowledge, Knower, and Known](#) §1.11; the practice path belongs in the planned study *Spiritual-Practice-And-Realization*.

The texts also call *jeevan* indivisible and immortal. Madhyasth Darshan reads “indivisibility” as functional: the constitution is self-maintaining and does not spontaneously lose completeness. “Immortal” means the sentient unit does not lose constitutional completeness — not that it has no parts in a mereological sense.

“Jeevan continues to exist even after death as it does while driving a body.”

- *JV*, p. 20

The texts infer this continuity from the conservation principle together with *jeevan*’s constitutional immortality — a philosophical inference within the darshan, not an empirical demonstration independent of its premises (§6.2.4). Identity across time is continuity of constitution: the same constitutionally complete configuration persists across bodily death and

re-association with a new body — the system’s **rebirth** / **transmigration** claim. MVD’s ninth Reality proposition states explicitly that *jeevan* is immortal and birth and death are occurrences (MVD, p. 13). That claim is subject to the same evidential standard as post-death continuity generally: text-based philosophical inference within the darshan, not independent public confirmation (§6.2.4, §6.4). Death is an event of the body, not of *jeevan* (MVD, p. 13; JV, p. 20).

During life, not only after death, *jeevan* must be distinguished from the body it drives. Mistaking the body for the self is the root of delusion in the knowledge order (SB, pp. 91–92). The body sleeps, eats, and ages; those cycles fulfil insentient composition. *Jeevan* does not sleep when the body sleeps — its activity continues as projection and reflection toward resolution. Values and evaluation are *jeevan*’s practical purpose; bodily sustenance alone is not *jeevan*’s fulfilment. The body is **medium and instrument**, not the sentient self — which is why the delusional plane marks body-identification and awakening marks *jeevan* organising conduct through higher *drishti*.

1.9.2 Plane transitions T2 and T3

Activity and conduct completeness mark the second and third plane transitions within constitutionally complete *jeevan* in the knowledge order (SB, pp. 51–52):

Transition	Completeness stage	From → to	What becomes evident
T2	Activity (<i>kriyapurnata</i>)	Delusional → deific	Awakened humans; orderliness with <i>ness</i>
T3	Conduct (<i>vyavaharpurnata</i>)	Deific → divine (complete)	Awakened humans with evidence (<i>pramanikta</i>); highest benevolence

MVD distinguishes **delusional** and **awakened** knowledge-order humans by kosha exposition: the animal order and delusional knowledge order share four koshas; awakened humans express all five, including *vigyanmaya* (MVD, pp. 49–50). Deluded humans remain in the delusional plane; awakening moves a human into the deific plane; conduct completeness with authentic evidence moves toward the divine plane. Plane membership for **humans** can change with study and realization, even though the sentience threshold itself does not lapse (SB, p. 55).

On the delusional plane, conduct often treats bodily comfort or family advantage (*priya, labh*) as final self-interest — for example, a parent who secures resources for their household while treating conflict as a contest to be won rather than a relationship to be resolved, because the body and its extensions are mistaken for *jeevan*. Awakening on the deific plane reorganizes the same relationships through humane perspectives: family decisions weighed for justice and resolution (*nyaya, samadhan*), not dominance; the ecological orders treated as complementary participants in orderliness, not mere resources to extract. Conduct completeness toward the divine plane adds authentic evidence (*pramanikta*) — benevolence that oth-

ers can recognize, not private conviction alone ([Human Behavior and Society](#); [Ethics-And-Morals-In-Human-Beings](#) §3.2).

1.9.3 Six perspectives and Awakening Progression

In the knowledge order, *jeevan*’s design includes six evaluative **perspectives** provisioned in coexistence — lower *priya*, *hita*, *labh* and humane *nyaya*, *dharma*, *satya* (MVD, pp. 58, 60). Unawakened humans operate through the lower three; humane perspectives are present in the design but become the organizing refuge only as **Awakening Progression** advances toward activity and conduct completeness (MVD, p. 27). Qualification, perspective, and worldview arise through capacity, ability, and receptivity together with study and environment (MVD, pp. 134, 142) — the mechanism defined in the section on relationships.

Awakening is not binary: MVD describes tiers from partial alignment through those who have realised truth and embody justice and *dharma* (MVD, p. 160). Lower *drishti* are subordinated to higher, not erased. The behavioural, social, and pedagogical treatment of the six perspectives belongs in [Ethics-And-Morals-In-Human-Beings](#) and [Human Behavior and Society](#); here the ontological point is that evaluative perspective is provisioned in *jeevan*’s constitution and activated through awakening, not invented by culture.

1.9.4 Omnipresence as *Gyan*: intelligibility-ground

The source calls Omnipresence **Knowledge** (*gyan*): intelligibility and orderliness as ground — reality such that it can be known, is orderly, transparent, and lawful — rather than an act of cognition (MVD, p. 35; also named in the opening account of coexistence). MVD p. 35 states that knowledge itself is the omnipresent Omnipotence, referred to as Space.

A physicalist may identify intelligibility with **lawfulness** — regularities describable by equations. Madhyasth Darshan does not deny lawfulness; it treats lawfulness as how orderliness appears in the material register. *Gyan* as *satta* names something further: the **coexistential ground** in which reality is permeative and transparent (MVD, p. 11), definite **relationships** with predetermined expectations toward completeness are real (MVD, p. 62), and units **recognise and fulfil** one another so that value flows in mutuality (SB, p. 50; JV, p. 69). Orderliness is therefore relational and evaluatively structured — participation-as-value across orders — not merely statistical regularity. Constitutional completeness is itself “disciplined and bounded by the law of recognising and fulfilling among multiple parts” (MVD, p. 77): intelligibility includes **definite mutuality**, not only pattern.

That ground manifests in **tiers**. All saturated units participate in inherent orderliness — radiance and projection in insentient nature (SB, p. 69). At *gathanpurnata*, the stable atom-configuration acts as a **mediating configuration** through which ever-present *gyan* manifests as active sentience — the Saturation-Reflector Model (§6.6). Tier-one orderliness and tier-two active sentience are distinct ontological registers; collapsing *satta-as-gyan* into Advaita’s *chit* (Brahman as awareness itself) erases that distinction (§6.2.9; Editorial Notes).

Four registers must be kept apart when reading the texts on knowledge and progress. **Realisation Knowledge** (*anubhav jnan*, MVD p. 11) names the ontological **given** — sentient and insentient units saturated in Omnipresence with form, properties, essential nature, *dharma*, and orderliness; it is not the engine that pushes insentient atoms through development. **Gyan as *satta** is the state-complete intelligibility-ground that conserves and regulates all activity without performing it (MVD p. 35; SB pp. 68–69). **Realisation in coexistence** is the telos of both progressions and complete knowledge (MVD p. 116; SB p. 51) — relationships fulfilled and evident, not a new state of the ground. **Gyan udghatan** — the unfolding of knowledge — is how awakened knowledge-order jeevan* actively participates in that telos; it does not drive physicochemical development (MVD pp. 115–116, 289). The epistemic evidence chain — realisation evidenced in conduct — belongs in [Knowledge, Knower, and Known](#) §§1.7–1.8.

1.9.5 Jeevan as knower; gyan udghatan

The knowing act (*chaitanya*) belongs only to *jeevan*. MVD p. 289 states explicitly that **the unfolding of knowledge** (*gyan udghatan*) occurs **only** through the sentient aspect (*jeevan*) or thoughts — not through insentient units and not through Omnipresence acting as a knower. MVD p. 115 adds a narrower formulation: knowledge is inherent everywhere, but **its unfolding happens by awakened humans** — a sleeping, deluded *jeevan* cannot unfold it. The same passage describes a sensory/cognitive pathway: vibrational motion on the brain from the cognitive organs leads to the unfolding of knowledge. *Gyan* as a name of *satta* is the intelligibility-ground; *gyan udghatan* is an activity exclusive to awakened *jeevan*.

Jeevan participates in a structure of development and awakening that is **definite** and provisioned in coexistence — existence is stable, development and awakening are definite, and all the laws are natural and inherent to being and abiding (MVD, p. 5). In the Verity chain, orderliness **is** development and awakening (MVD, p. 15). MVD also provides for the study of development progression and awakening progression as distinct provisions in coexistence (MVD, p. 87; JV, p. 59). Units manifest what is provisioned and inherent through growing capacity, ability, and receptivity, study, and environment (MVD, pp. 27, 134, 142) — not by creating the frame from nothing.

For epistemic structure (*gyan-vivek-vigyan*, realization, and evidence), including why “mystery” names incomplete understanding rather than an irreducible limit of existence, see [Knowledge, Knower, and Known](#) §1.11 (MVD, Ch. 17, pp. 273, 301). *Jeevan* is therefore a constitutionally complete sentient unit working through the body, not identical with it; awakening reorganizes projection and reflection toward humane *drishti* within that same ontology — it does not introduce a second kind of self. Conservation and beginninglessness follow from the same picture.

1.10 Conservation of reality and beginninglessness

Madhyasth Darshan advances **two conservation claims** that must be kept apart from the outset.

Coexistence conservation holds that what exists does not arise from non-being (*abhava*) and does not vanish into it — only configurations, bodies, and associations begin and end. That reading is **consonant with** careful physics accounts of configuration change while quantities persist (§4.3). Conservation is asserted of **each** existing particular — underlying *vastu* persists through configuration change — not as a conserved aggregate summed over all units; under the practical-uncountability reading (§1.7), that particularist form is the correct way to read “nothing is annihilated.”

Jeevan persistence, rebirth, and transmigration is a separate commitment. The texts infer that an immortal sentient unit continues after bodily death and may re-associate with a new body (JV, p. 20; MVD Reality proposition 9). That inference **does not follow** from physics-style quantity conservation alone: science conserves mass-energy and charge, not particular composite configurations or functional identities. JV’s charcoal analogy illustrates that underlying *vastu* survives transformation; it does not by itself prove that **this** constitutionally complete sentient configuration persists as the same *jeevan* across a gap of embodiment. Post-death continuity rests on *gathanpurnata*, functional indivisibility, and text-based philosophical inference (§6.2.4).

Existence is **beginless**: what exists has always existed, though its form, configuration, and states are in constant flux.

“That which exists continues to be, and that which was not, does not come into existence. Therefore, existence will remain as it is till eternity.”

- SB, p. 49

“Nothing arrives at birth nor does anything depart with death. All that is, exists forever.”

- JV, p. 20

Coexistence conservation in detail. Madhyasth Darshan holds that what exists does not arise from non-being and does not vanish into it. This ontology distinguishes absolute annihilation (*vinasha*) from physical transformation (*roopantaran*). An entity changes configuration (*roop*), but its underlying substance (*vastu*) is never destroyed.

Ice melting to water and boiling to steam is the same *vastu* in successive configurations; wood reduced to ash and smoke persists as transformed products, not as passage into absolute nothing. The texts use charcoal to make the same point in their own idiom:

“A piece of charcoal continues to exist in other forms even after burning it.”

- JV, p. 20

“At the fundamental level, a ‘reality’ never gets annihilated.”

- JV, p. 20

From this follow: (1) existence (*astitva*) as coexistence (*saha-astitva*) is beginningless and endless; (2) Omnipresence (*satta*) does not begin, change, or end; (3) units do not arise from *abhava* and do not vanish into it; (4) particular bodies, configurations, relations, and states do begin and end; (5) development and awakening are real processes within beginningless coexistence.

Jeevan persistence in detail. The texts infer that *jeevan* — an immortal sentient unit whose constitutional completeness does not lapse at bodily death — continues after bodily death as it does while driving a body, and may **re-associate** with a new body. That is a **re-birth / transmigration** commitment within the darshan, resting on separate metaphysical premises — not on thermodynamic or field-theoretic conservation theorems. It is subject to the same evidential bar as other claims exceeding public science (§6.4).

MVD's nine Reality propositions compress the positive ontology; the closing subsection states *jagat satat* in that systematic context. §5 compares this conservation-based picture with rival views.

1.11 The Perpetual World: *Brahma Satya Hai, Jagat Satat Hai*

MVD presents nine co-implicated **Reality** propositions (pp. 12–13). One of them compresses the ontology:

“Brahma is truth, the world is perpetual.”

- MVD, p. 13

The full set gives systematic context — the slogan is not isolated:

1. Brahma is truth, the world is perpetual.
2. Brahma (Omnipotence) is omnipresent, and *jeevan*-clouds are many.
3. *Atma, buddhi, chitta, vritti*, and *mun* are indivisible in a *jeevan*-cloud.
4. The grandeur of humans as a joint form of *jeevan* and body.
5. God is omnipresent, deities are many.
6. Human kind is one, vocations are many.
7. Earth is one (undivided nation), States are many.
8. Human dharma is one, resolutions are many.
9. *Jeevan* is immortal; birth and death are occurrences.

Nagraj's autobiographical account describes the Vedanta formula *Brahma satya, jagat mithya* as part of his intellectual background; Madhyasth Darshan's *jagat satat* (perpetual world) stands in **structural contrast** with that background within the nine Reality propositions (§5.7).

Madhyasth Darshan holds that Brahma is real, the world is real, and their inseparable presentness is coexistence (*saha-astitva*).

Coexistence as an **organic whole** does not dissolve plurality into the ground. Brahman (*satta*) remains state-complete — Knowledge and Omnipresence — while countless units remain state-dynamic, each saturated in the ground, each carrying its four-aspect signature, each progressing as unit-and-environment toward completeness. The whole is mutual complementarity, recognition, and value reciprocity across orders; give–take restoration and definite destiny as orderliness structure all change. **Realisation in Omnipresence** — the terminus of both Development and Awakening Progressions named at SB p. 51 — is coexistence evident in fulfilment: *jagat satat* names a perpetual structured world, not a world sublated at the highest truth (§5.7). SB concludes that manifesting this coexistence is the natural foundation of resolution-centred inquiry across material, behavioural, and realisation-centred life (SB, p. 66); social and pedagogical expression belongs in the companion studies on behaviour and ethics.

2. The Advaita Vedanta Answer

Advaita Vedanta provides a contrasting framework to Madhyasth Darshan: it asserts that existence in the strictest, absolute sense is Brahman alone, one without a second. In this view, the world of names, forms, bodies, and relations is *mithya*—a dependent appearance that is operationally valid at the empirical level (*vyavahara*) but ultimately sublated at the level of absolute reality (*paramartha*). The true Self (*Atman*) is neither born nor destroyed, because it is ultimately identical with this non-dual Brahman.

Advaita's standard framework is three-tiered, separating private apparent errors (*pratibhasika*, such as a rope mistaken for a snake) from shared empirical reality (*vyavahara*, which governs bodies, physical laws, ethics, and scripture) and the absolute truth of Brahman (*paramartha*).

Three tiers of reality — lower tiers are real only relative to the one above

Absolute (paramartha) — Brahman alone

Being, consciousness, bliss (sat-chit-ananda). One without a second.
Beginningless, partless, actionless, changeless. Pure awareness itself.

The true Self (Atman) is identical to this. There is no second thing.

sublated by knowing Brahman

Empirical (vyavahara) — the shared world

Operationally valid, law-governed, public. Sublated only by knowing Brahman.

Jiva

embodied self,
conditioned by upadhis

Ishvara

Brahman with Maya,
operative cause

Jagat

world of name-form,
bodies, laws, scripture

sublated by correction

Apparent (pratibhasika) — private error

Rope seen as a snake, dream objects. Corrected by waking or a second look —
not shared, not law-governed.

Two relations hold it together

Maya / adhyasa

The world is superimposed on Brahman
like a snake on a rope. Maya conceals
Brahman and projects multiplicity.

Moksha

Not merger. The jiva was never separate;
liberation is recognising one's identity
with Brahman. Separateness dissolves.

2.1 Brahman, Sat-Chit-Ananda, and the tiers of reality

“In the beginning this was Existence alone, One only, without a second.”

- CU 6.2.1

Shankara glosses *sat* as:

**“mere Existence, a thing that is subtle, without distinction, all pervasive,
one, taintless, partless, consciousness”**

- CU 6.2.1, Shankara commentary

The text rejects existence arising from non-existence:

**“By what logic can existence verily come out of non-existence? But
surely, o good looking one, in the beginning all this was Existence, One
only, without a second.”**

- CU 6.2.2

A second classical formulation names existence not only as *sat* — bare being — but as **Sat-Chit-Ananda**: being-consciousness-bliss. These are not three realities added together; Brahman is one partless reality whose nature is expressed in three inseparable names.

“Brahman is Truth, Knowledge, and Infinity.”

- TU 2.1.1

Shankara’s tradition reads *satyam* as being/reality, *jnanam* as consciousness, and *anantam* as the infinite. The *anandamaya* passage (TU 2.5) leads the seeker beyond even bliss-as-sheath to the Self beyond all coverings. Shankara states the mature formula in the *Vivekachudamani*:

“By that alone he comes to know his own Self as Existence-Knowledge-Bliss Absolute and becomes happy.”

- VC, v. 152

The same triad recurs at v. 217, one of the most comprehensive Self-descriptions in the *Vivekachudamani*:

“That which clearly manifests Itself in the states of wakefulness, dream and profound sleep; which is inwardly perceived in the mind in various forms as an unbroken series of egoistic impressions; which witnesses the egoism, the Buddhi, etc., which are of diverse forms and modifications; and which makes Itself felt as the Existence-Knowledge-Bliss Absolute; know thou this Atman, thy own Self, within thy heart.”

- VC, v. 217

The Mandukya Upanishad (MU, vv. 3–7) grounds this analysis in the three states (*avasthaya*): waking, dream, and deep sleep — with **turiya**, the witness beyond all states, as ultimately real. In this scheme:

1. **Sat** — Brahman is existence; to exist absolutely is to be Brahman.
2. **Chit** — consciousness is the very nature of reality and Self, not a function of brain or mind.
3. **Ananda** — bliss is the intrinsic fullness of the Self, free from lack and dependence on objects.

Advaita concentrates existence in one partless reality that is being, consciousness, and bliss without a second. Brahman alone exists absolutely. The world is not sheer nothing, nor absolutely real; it is *mithya*.

“A firm conviction of the mind to the effect that Brahman is real and the universe unreal, is designated as discrimination (Viveka) between the Real and the unreal.”

- VC, v. 20

“The individual soul is itself and directly the Supreme Brahman, and nothing else.”

- VC, v. 216

The clay-pot analogy (a *satkaryavada* illustration; see §5):

“All modifications of clay, such as the jar, which are always accepted by the mind as real, are (in reality) nothing but clay. Similarly, this entire universe which is produced from the real Brahman, is Brahman Itself and nothing but That.”

- VC, v. 251

Level	What exists?	Status of world / error
Apparent (<i>pratibhasika</i>)	Rope-snake, dream objects, private errors	Sublated by waking or correction
Empirical (<i>vyavahara</i>)	Bodies, minds, Ishvara, causes, duties, scriptures, science	Shared, law-governed; operationally valid; sublated only by <i>brahma-jnana</i>
Absolute (<i>paramartha</i>)	Brahman alone	World is <i>mithya</i> , dependent appearance

At *vyavahara*, the world is not unreal in the way a hallucination is; it is unreal **relative to Brahman** — like a dream relative to waking. This distinction matters for comparing Advaita’s ethics and science with Madhyasth Darshan’s perpetual world (§6.3).

2.2 Structural entities and witness-consciousness

Because Advaita utilizes a three-tier framework of reality, it posits several “entities” that are structurally necessary to explain the empirical world, even if they are ultimately sublated at the absolute level. These are the specific concepts compared against Madhyasth Darshan in §5:

1. **Brahman / Paramatman:** The sole absolute reality (*paramartha*). It is pure, actionless awareness.
2. **Maya:** The cosmic ontological power — Brahman viewed through *Maya* as Ishvara. It conceals Brahman’s true nature (*avarana*) and projects the multiplicity of the world

(*vikshepa*). VC vv. 243–244 distinguish **Maya** (cosmic, Ishvara’s superimposition) from **Avidya** (individual, jiva’s superimposition).

3. **Avidya**: Individual ignorance — the jiva’s superimposition of body-mind on the Self. Distinct from cosmic *Maya* (VC, vv. 243–244).
4. **Ishvara (Saguna Brahman)**: Brahman associated with *Maya*, functioning as operative cause of name-form manifestation (*vivartavada*) — not a creator *ex nihilo*. Ishvara is a *vyavahara*-level category sublated at *paramartha* (VC, v. 244): “**These two are the superimpositions of Ishwara and the Jiva respectively, and when these are perfectly eliminated, there is neither Ishwara nor Jiva.**”
5. **Jivatman (Jiva)**: The individual embodied soul — the true Self (*Atman*) conditioned by *upadhis* (e.g. *Pancha Kosha*), appearing as separate until realization.
6. **Jagat (Nama-Roopa)**: The physical universe of names and forms. Operationally valid at *vyavahara*; ultimately *mithya* at *paramartha*.

The *Drig-Drishya-Viveka* (DDV) offers a rigorous seer-seen (*drig-drishya*) discrimination: whatever can be observed — body, sensations, thoughts — is “seen” and therefore not the seer (DDV, vv. 1–5). What remains is *Sakshin*, witness-consciousness — irreducible to matter and closer to Advaita’s first-person route against physicalism than devotional VC passages alone (see §3.2, §5.5, §6.3). In the *Mandukya* analysis, *turiya* — the fourth, witness beyond waking, dream, and deep sleep — plays the same structural role: not another state among states, but the awareness in which states appear (MU, vv. 3–7; §2.1). At liberation, that witness is discovered as **non-personal Brahman** — one partless awareness without a second. Madhyasth Darshan agrees that the seer is not the seen body or brain-state, but locates the irreducible knower in **immortal jeevan** with active *gyan udghatan* (§1.9.5), not in a universal Self that finally absorbs all individuality.

2.3 Origination, liberation, and temporality

Brahman does not begin: it is beginningless, partless, actionless, non-dual. The universe as name-form has origination at the empirical level, but its ultimate truth is Brahman. Creation is therefore not production from nothing; it is manifestation of names and forms on the basis of Brahman (*vivartavada* — apparent transformation, contrasted with Madhyasth Darshan’s circular causality in §5.2).

Liberation (*moksha*) is not dissolution or merger of a real individual into Brahman. The jiva was never a separate entity; realization is **recognition of pre-existing identity** with Brahman, in which the illusion of separate individuality is dispelled:

“There is neither death nor birth, neither a bound nor a struggling soul, neither a seeker after Liberation nor a liberated one – this is the ultimate truth.”

- VC, v. 574

“The Supreme Brahman is, like the sky, pure, absolute, infinite, motionless and changeless, devoid of interior or exterior, the One Existence, without a second, and one’s own Self.”

- VC, v. 393

Advaita does not devote a separate chapter to *kaal*, but its framework implies a sharp division. **Brahman** is beginningless, changeless, motionless — outside temporal becoming (VC, v. 393). At **paramartha**, only Brahman is absolutely real; temporality belongs to the empirical order. At **vyavahara**, past, present, and future, birth and death, and causal succession are operationally valid — the world is law-governed and shared (§2.1) — yet finally sublated when Brahman alone is known.

The *Mandukya* analysis of waking, dream, and deep sleep (§2.1) is a first-person route into how temporal **states** appear and are witnessed; the witness (*turiya*) is not another state among them. Madhyasth Darshan accepts the reality of cyclical development and unit-activity across orders (§1.3–1.4) and refuses to sublimate the world at the highest realization; its account of *kaal* as duration of activity (§1.6) is therefore closer to a **realist** temporal ontology at every order, while still denying that time is a substance independent of activity. Comparison with Advaita’s *trikaal* language and with Madhyasth Darshan’s *trikaalabaddh* co-existence claim (SB, p. 48) is developed in [Nature-Of-Time](#) (§2.2, §4).

3. Modern Philosophical Approaches

If Advaita Vedanta represents a radical anti-materialism that subordinates the physical world to pure consciousness, modern Western philosophy of mind represents the opposite starting point. It takes the physical world as its baseline and struggles to locate subjective experience within it. The resulting debates on consciousness impose a severe explanatory burden of proof on any entity—such as *jeevan*—that claims to transcend physical mechanics, showing that the definition of what exists remains fiercely contested.

One level of reality, built upward by composition

Every concrete phenomenon is physical. Higher levels are arrangements of lower ones — no separate ground.

Quantum fields and spacetime

The base substrate. Conserved, all-pervasive. No inherent consciousness or teleology.

Particles

Localised excitations of the fields, not tiny enduring substances.

Atoms, molecules, matter

Bound structures, governed by physical law.

Brains and bodies

Evolved organisms. Mind is what the brain does.

The self

A model the brain generates to regulate the organism. No survival past brain death.

Causation

Efficient mechanism under conservation laws. No supreme ground, no purpose.

Method

Observation, modelling, public evidence. Third-person confirmation.

Two disputes physicalism has not settled

The hard problem

Why is there subjective experience at all? Reductionists, panpsychists and illusionists disagree sharply.

A beginning?

Standard cosmology dates the observable universe; whether the substrate itself began is unsettled.

3.1 Standard Physicalism: Concrete Reality Is Physical

“I take physicalism to be the view that every real, concrete phenomenon in the universe is...physical.”

- Strawson 2006, p. 2

On this view, what exists are physical things, events, fields, organisms, brains, and processes. Minds and selves are functions, organizations, models, or processes of physical systems.

3.2 The Hard Problem: Experience Resists Reduction

“The really hard problem of consciousness is the problem of experience. When we think and perceive, there is a whirl of information-processing, but there is also a subjective aspect.”

- Chalmers 1995, p. 3

“It is widely agreed that experience arises from a physical basis, but we have no good explanation of why and how it so arises.”

- Chalmers 1995, p. 3

“the fact that an organism has conscious experience at all means, basically, that there is something it is like to be that organism.”

- Nagel 1974, p. 1

For Madhyasth Darshan this is evidence that body-only ontology is incomplete. Advaita's DDV offers a complementary first-person route: the seer cannot be the seen (DDV, vv. 1–5), so consciousness resists reduction to observed brain-states — though Advaita and Madhyasth Darshan draw different ontological conclusions from that datum. Physicalists treat that explanatory gap as philosophically non-decisive; Madhyasth Darshan treats it as evidence of ontological incompleteness in matter-only accounts (§6.2.1, §6.4).

3.3 Panpsychist Physicalism: Experience as Fundamental

“Full recognition of the reality of experience, then, is the obligatory starting point for any remotely realistic version of physicalism.”

- Strawson 2006, p. 2

“Experiential phenomena cannot be emergent from wholly non-experiential phenomena.”

- Strawson 2006, p. 12

“Real physicalism, realistic physicalism, entails panpsychism.”

- Strawson 2006, p. 12

This is closer to Madhyasth Darshan than reductive physicalism, since both refuse experience-from-dead-matter. Strawson's anti-emergence principle presses on the *gathanpurnata* account: if experience cannot emerge from the wholly non-experiential, sentience at completeness must be **actualized from an ever-present ground**, not produced from nothing — the latency reading developed in §6.6. Madhyasth Darshan also differs from Strawson in scope: it does not say every particle is a subject; active sentience is the status of constitutionally complete atoms only.

Panpsychism's **combination problem** bears directly on that restriction. If micro-experientiality is primitive, how do micro-subjects combine into a unified macro-subject? Strawson

and other panpsychists leave this wound open; IIT addresses it through integrated information structures, at the cost of pan-experiential commitments Madhyasth Darshan rejects. Madhyasth Darshan's answer is different in kind: **one constitutionally complete atom is already the sentient unit** — *jeevan* is not assembled from many micro-minds but is a self-maintaining composite whose completeness is functional indivisibility (§1.8–1.9). Whether that avoids the combination problem or relocates it to the threshold itself is examined in §6.6. The two views share an enemy (dead-matter reductionism) but not a metaphysic.

3.4 Alternative Western ontologies

Hylomorphism, Leibnizian monadology, process philosophy, and neutral monism offer closer Western analogues than mainstream philosophy-of-mind sources alone.

Aristotelian–Thomistic hylomorphism maps form (*forma*) onto matter (*materia*) so that a substance is the compound of both — not mere aggregation. Aquinas treats the rational soul as the **form of the living body** (*anima forma corporis*), giving a joint ontology of soul-and-body that parallels Madhyasth Darshan's *jeevan–shareer* joint form and the four-aspect unit signature (form, properties, essential nature, *dharma*) as what a unit **is** (§1.2). *Gathanpurnata* resembles substantial completion: a definite constitution at which a unit's essential nature is fully actualized. The divergences are sharp: MD's plural, immortal *jeevan* units, beginningless coexistence with *satta*, and saturation are not Aristotelian prime matter plus a single rational soul per body; yet the soul-as-form debate is a nearer cousin than process philosophy on individual persistence (SEP Form and Matter; Aquinas ST I, q. 75–76).

Spinoza's substance monism offers a closer analogue to *satta*-with-units than neutral monism. For Spinoza, one infinite substance (*Deus sive Natura*) has infinitely many **modes** — finite particulars expressing the one substance under different attributes (thought and extension). Madhyasth Darshan likewise keeps a pervasive ground and countless real units, but the contrast is decisive: Spinoza has **one** substance whose modes are not ontologically on a par with the whole; Madhyasth Darshan has **co-eternal** *satta* and *ikai*, each real in its own right, bound by saturation rather than modal expression of a single substance (Spinoza, *Ethics*, Part I, Props. 14–15; Part II, Def. 3). Spinoza's parallelism of thought and extension also differs from Madhyasth Darshan's tiered intelligibility: active *chaitanya* belongs only to *jeevan*, not to every mode of extension.

Leibnizian monads offer a tighter analogue to plural immortal *jeevan* than Whitehead's occasions. Monads are simple, individual substances that mirror the whole from their perspective, do not interact by efficient causation but harmonize, and do not naturally perish. That plurality-with-harmony and individual immortality align structurally with many distinct *jeevan*-clouds saturated in Omnipresence (MVD, p. 13). The contrast: monads are windowless and perception-based; *jeevan* works through bodies in definite *sambandh* and fulfils relationships in nature's orders (Leibniz, *Monadology*, §§1–14, 78–81).

Whitehead's process philosophy shares relational realism and refusal of nature bifurcation. His basic units are "actual entities" — "drops of experience, complex and interdependent" (Whitehead 1929, p. 28). The key contrast remains persistence: Whitehead's occasions are momentary and "perpetually perish" subjectively, gaining "objective immortality" only as data for successors (Whitehead 1929, p. 44), whereas Madhyasth Darshan's *jeevan* is a persisting immortal individual.

"Actual entities 'perpetually perish' subjectively, but are immortal objectively."

- Whitehead 1929, p. 44

Neutral monism (Russell, Mach) resembles Omnipresence as a reality that is neither mind nor matter but common ground. Russell holds that mind and matter are "composed of a neutral-stuff which, in isolation, is neither mental nor material" (Russell 1921, Lecture I). Mach likewise denies any "rift between the psychical and the physical": "There is but one kind of elements, out of which this supposed inside and outside are formed" (Mach 1914, Ch. XIV). The contrast: neutral monism typically builds mind and matter out of the neutral stuff, whereas Madhyasth Darshan keeps Omnipresence non-transforming and lets units be real in their own right rather than constructed from the ground.

"Both mind and matter are composed of a neutral-stuff which, in isolation, is neither mental nor material."

- Russell 1921, Lecture I

"There is no rift between the psychical and the physical, no inside and outside... There is but one kind of elements, out of which this supposed inside and outside are formed."

- Mach 1914, Ch. XIV

3.5 Illusionism: Phenomenal Consciousness as Misdescription

"Another approach, which holds that phenomenal consciousness is an illusion and aims to explain why it seems to exist."

- Frankish 2016, p. 1

"illusionists deny the existence of phenomenal consciousness properly so-called, but do not deny the existence of a form of consciousness"

- Frankish 2016, p. 8

Madhyasth Darshan regards this as another reductionism: it treats experience, valuation, aspiration, and realization as activities of *jeevan*, not brain-model illusions. Illusionism matters because it shows how far naturalism will go to preserve a physicalist ontology.

4. Modern Scientific Approaches

While modern science does not put forward a single metaphysical dogma, its default working ontology aligns with §3.1 physicalism unless the hard problem forces a revision (§3.2–3.3). It seeks to explain the self as an emergent product of evolutionary and neurobiological processes, and the universe as a dynamic physical system.

4.1 Cognitive Science & Neuroscience: The Brain as Generator of Self

Self-model theories in cognitive science (pioneered philosophically by Metzinger 2003) build upon the physicalist premise. They argue that the self is not an immortal unit, but a predictive model generated by the brain to regulate the organism:

“minimal selfhood emerges as the result”

- Limanowski and Blankenburg 2013, p. 1

“these accounts propose to ‘understand the elusive sense of minimal self in terms of having internal models that successfully predict or match the sensory consequences of our own movement, our intentions in action, and our sensory input’.”

- Limanowski and Blankenburg 2013, p. 3

This is nearly the opposite of the *jeevan* ontology. For Madhyasth Darshan the self is a real sentient unit using the body; for self-model theory the self is a model generated by embodied prediction. Madhyasth Darshan answers that rival through **latency**: sentience is actualized from the ever-present ground at constitutional completeness, not generated as a new ingredient from dead matter (§6.6). Self-model theory explains regulation and representation; it does not settle whether the regulator is only neural or a distinct *jeevan* working through the brain.

Autopoiesis (Maturana and Varela) treats living organization as a self-producing network that maintains its boundary and identity through continuous metabolism — “a machine organized as a network of processes of production of components” that “continuously regenerate and realize the network that produces them” (Maturana and Varela 1980, p. 78). This parallels Madhyasth Darshan’s emphasis on self-maintaining constitutional completeness and bio-order cyclicity, but autopoiesis describes organizational closure in biology, not the ontological saturation of units in *satta* or the latency of sentience at *gathanpurnata*.

Integrated Information Theory (IIT) proposes that consciousness corresponds to integrated information (Φ) in a system, with a quantitative threshold producing a qualitative difference — “an experience is a maximally irreducible conceptual structure” (Tononi 2012). IIT is a useful **physicalist mirror** of threshold grammar: like *gathanpurnata*, it ties consciousness to a structural condition. The contrasts are decisive: IIT is pan-experiential at the fundamental level in many formulations, operational and measurement-oriented, and silent on immortal individual units or coexistential ground; Madhyasth Darshan restricts **active** sen-

tience to constitutionally complete reflector atoms and locates latency in *satta* as *gyan* (§§1.9.4, 6.6).

4.2 Physical cosmology and cosmic beginnings

The standard cosmological model suggests the observable universe had a beginning ~13.8 billion years ago. Several non-singular research programs (loop quantum cosmology’s “bounce,” Penrose’s conformal cyclic cosmology, eternal inflation) are comfortable with a beginningless physical substrate even when local configurations begin and end. These are competing speculative programs, not consensus — the most this comparison claims is **conceptual resonance** with Madhyasth Darshan’s claim that nature (*prakriti*) is perpetual (*satat*) (Ashtekar and Singh 2011; Penrose 2010; Guth 2007).

4.3 Physics & Conservation Laws

The “nothing is annihilated” principle and modern physics — handle with care.

Particle–antiparticle annihilation and pair creation are not passages into or out of absolute non-being: in quantum field theory (see standard treatments, e.g., Weinberg 1995), particles are localized excitations of conserved, all-pervasive fields, and annihilation transforms one excitation (matter) into another (radiation) under strict conservation laws. This is broadly consonant with the claim that fundamental reality (*vastu*) is conserved while configurations (*roop*) transform. The alignment should not be overstated: fields are not “substances that persist” in quite the sense *vastu* intends, and energy conservation itself is subtle in General Relativity (it is tied, via Noether’s theorem, to time-symmetry that need not hold globally in an expanding spacetime; see Carroll 2010).

Fields vs. *vastu*. In quantum field theory, what persists are field configurations and conserved quantities; a “particle” is a localized excitation, not a tiny enduring substance. Madhyasth Darshan’s *vastu* names an underlying reality that survives every *roop*-change. The parallel is structural (configuration changes, something is conserved), not identity of category: fields are mathematical-physical entities governed by equations, not countable units with *dharma* saturated in Omnipresence.

***Satta* and physical fields (misleading analogies).** A dynamical field carries energy-momentum, exerts force, and propagates waves — nothing like the actionless (*kriya-shunya*), non-transforming *satta* (§1.3). Comparing *satta* to a physical field is therefore misleading. The nearest physical analogue — non-dynamical background geometry or the quantum vacuum ground state — captures only that units depend on a uniform ground; it drops the darshan’s second half: uniform energy stays unmanifest without unit activity (§1.3). The parallel is illustrative, not identity.

Time (*kaal*) vs. spacetime. Modern physics treats spacetime as a dynamical entity — it can expand, curve, and in some models begin locally. Madhyasth Darshan treats *kaal* as the **duration of unit-activity**, numerically reckoned by humans within existence (§1.6; SB, pp. 65, 251; MVD, pp. 34, 195) — not an independent cosmic container. Omnipresence is time-

less as non-transforming ground. The contrast is over whether temporality belongs to the ground of reality or only to transforming units, and over whether spacetime is fundamental physics or derivative of measurement conventions on activity. Relational and process philosophies of time (§3.4) share some structural affinity with activity-based *kaal*; block-universe eternalism does not. Comparative detail: [Nature-Of-Time](#).

Entropy vs. orderliness (*vyavastha*). Thermodynamics describes a statistical arrow toward disorder in closed systems. Madhyasth Darshan asserts inherent orderliness at every order, with development toward greater organization when units are in their natural state. These are not straightforward opposites — biological and ecological systems can increase local order at the cost of entropy elsewhere — but they use different notions of “order.” The second law neither supports nor refutes coexistence orderliness.

Against all of these, Madhyasth Darshan makes a stronger claim: coexistence is eternal, units are not annihilated, and *jeevan* is immortal. This eternalism is consistent with conservation principles and beginningless cosmological models; individual immortality and constitutional completeness are distinct metaphysical commitments examined in §6.2.

5. Comparison

The sections below compare entities and causal doctrines across traditions; §6 evaluates each position. The table in §5.1 maps each tradition on the paper’s framing questions and related themes; §§5.2–5.8 develop those rows in detail.

5.1 At-a-glance comparative summary

Question	Madhyasth Darshan	Advaita Vedanta	Modern physicalist approaches
What is existence?	Eternally present coexistence: Omnipresence plus all units held in it.	Brahman / Existence alone, one without a second.	Concrete physical reality, studied empirically.
What exists?	Omnipresence and real units, sentient and insentient.	Brahman alone (absolutely); world <i>mithya</i> at <i>paramartha</i> .	Usually the physical; experience disputed.
Does it begin?	No — what exists does not come from non-existence; bodies and configurations do.	Brahman does not begin; name-form at <i>vyavahara</i> .	Particular systems begin and end; cosmology unsettled.

Question	Madhyasth Darshan	Advaita Vedanta	Modern physicalist approaches
Does the individual self begin?	<i>Jeevan</i> does not begin at birth or die with the body.	<i>Jiva</i> is ultimately Brahman; separate individuality dispelled at realization (VC, vv. 244, 574).	Self develops as biological/cognitive process.
What is time?	Duration of unit-activity; human numerical reckoning within existence; <i>satta</i> timeless as ground (§1.6).	Brahman beyond temporal becoming; time valid at <i>vyavahara</i> , sublated at <i>paramartha</i> .	Spacetime as dynamical physical structure; philosophy of time contested.
Is the world finally real?	Yes. “Brahma is truth, the world is perpetual.”	Empirically valid but ultimately <i>mithya</i> .	Yes, as physical reality.
Method of knowing	Study, realization, behavior, experiment.	Scripture, reasoning, contemplative discrimination.	Observation, modelling, public evidence.
Ethical consequence	Humane conduct evidences understanding of coexistence.	Ethics prepares the mind for liberation.	Ethics via naturalism, social/normative theory.

5.2 Causal doctrine: *Satkaryavada*, *Vivartavada*, and Madhyasth Darshan

Causal doctrine is the deepest structural difference between the three systems — it determines how each tradition treats origination and beginninglessness (§5.1, “Does it begin?”).

Advaita (Sankhya inheritance): *Satkaryavada* — the effect pre-exists in the cause (clay-pot, VC v. 251). At the empirical level, creation is *vivartavada*: apparent transformation of name-form on changeless Brahman — the effect is not a real transformation of the cause. Brahman does not change; multiplicity is projected through *Maya*.

Madhyasth Darshan: Denies single-material-cause reduction and linear efficient-cause chains. *Satta* is *mahakaran* (supreme sustaining cause), not efficient cause (§1.3). Units change through the single activity triad *shram–gati–parinam*, read toward completeness in sentient nature through projection, reflection, and *samadhan*, with circular activity, order-specific cyclicity, and *sanskar*-mediated human cycles. Conservation of *vastu* through *roop*-change resembles *parinamavada* at the unit level, but the full picture is not reducible to “*parinamavada*-like” alone.

Modern physicalism: Strict efficient causation — mechanism, fields, conservation laws. Origination of particular systems is compatible with a beginningless substrate (§4.2); no teleology or supreme ground.

Aspect	Advaita	Madhyasth Darshan	Modern physicalism
Effect in cause?	Yes (<i>satkaryavada</i>)	Units eternal; change is transformation within coexistence	Conservation laws; particles as field excitations
Cause transforms?	No (Brahman changeless; <i>vivarta</i>)	<i>Satta</i> non-transforming; units transform	Fields/spacetime dynamical
Origination vs change	Name-form originates at <i>vyavahara</i> ; Brahman does not begin	No origination from <i>abhava</i> ; development and awakening	Local systems begin/end; substrate unsettled

5.3 Entity categories compared

§5.4 tabulates entities; what follows groups them by tradition.

The entity matrix in §5.4 compares traditions that share a **grammar of enduring entities** — cosmic ground, individual self, material reality, relationships, causation, and ultimate purpose. **Buddhist** traditions, especially Madhyamaka, are omitted from that matrix **methodologically**, not because they are irrelevant. Madhyamaka denies intrinsic *svabhava* and *anatta* denies an enduring self; it does not answer “what entity type is the self?” within the same grammar — it challenges whether the table’s categories apply at all. A Buddhist column would misrepresent Buddhism as offering parallel rows for ground and self when its sharpest pressure is against the table’s presuppositions. **Anatta** and Nagarjuna’s critique belong in §6.2.2, where the gravest comparative threat to immortal distinct *jeevan* is engaged directly (see also §5.4 preamble).

Modern philosophy (§3):

1. **Cosmic Ground:** Form–matter compound (hylomorphism); one substance with modes (Spinoza); harmonized monads (Leibniz); neutral stuff (neutral monism); or creativity/becoming (process).
2. **Individual Self:** Soul-as-form of body (hylomorphism); simple monads (Leibniz); self-model (physicalism); or experiential monads (panpsychism).
3. **Material Reality:** Physical matter and energy; or the outer aspect of experiential units (panpsychism).
4. **Causation:** Formal and final causation (hylomorphism); pre-established harmony (Leibniz); efficient mechanism (physicalism); or creative concrescence (process).

Modern science (§4):

1. **Cosmic Ground:** Dynamic spacetime and quantum fields — no inherent consciousness or teleology.
2. **Individual Self:** Brain-generated cognitive agent; no post-death survival.
3. **Material Reality:** Localized field excitations; conserved under physical law.
4. **Causation & Order:** Physical causation, entropy, evolved ecological cooperation.

5.4 Entity comparison

The table compares primary entities across the four traditions this paper develops in the body. Abrahamic and Dvaita ontologies are outside scope. **Buddhist** traditions are excluded from the matrix for the methodological reasons stated in §5.3: Madhyamaka and *anatta* challenge the enduring-entity grammar the table presupposes rather than answering it in parallel columns. **Anatta** and Nagarjuna's *svabhava* critique are central to the ontology and are engaged at length in §6.2.2 — the proper venue for the tradition this paper treats as its gravest philosophical threat.

DRAFT

Entity Category / Attribute	Madhyasth Darshan (Co-existentialism)	Advaita Vedanta (Non-Dualism)	Contemporary Philosophy (Process, Physicalist, Panpsychist)	Modern Science (Physics, CogSci, Cosmology)
Cosmic Ground	Omnipresence (Satta / Space): Pervasive, formless, actionless energy (<i>kriya-shunya</i>). Inherent energy and regulation in units through saturation (<i>samprikt</i>); uniform energy manifests as activity only through units (§1.3).	Brahman: The single, non-dual absolute reality (<i>Sat-Chit-Ananda</i>). The world is <i>mithya</i> (dependent appearance) at <i>paramartha</i>.	Form + Matter (Hylomorphism): Substantial form actualizing matter. Substance + modes (Spinoza): One <i>Deus sive Natura</i>, finite modes. Monad field (Leibniz): Simple substances in harmony. Creativity / God (Process): Dynamic process. Neutral Stuff (Neutral Monism): Common element.	Spacetime & Quantum Fields: Dynamic, physical substrate. No inherent consciousness or teleology.

Entity Category / Attribute	Madhyasth Darshan (Co-existentialism)	Advaita Vedanta (Non-Dualism)	Contemporary Philosophy (Process, Physicalist, Panpsychist)	Modern Science (Physics, CogSci, Cosmology)
Individual Self / Sentience	Jeevan: A constitutionally complete, immortal atom (<i>gathanpurna parmanu</i>). Many distinct, eternal <i>jeevan</i> exist.	Jivatman / Atman: Individuality (<i>jivatman</i>) is a <i>vyavahara</i> superimposition (VC, v. 244). The true Self (<i>Atman</i>) is identical to Brahman.	Rational Soul as Form (Hylomorphism): Form of the living body. Monad (Leibniz): Simple, mirroring, immortal substance. Self-Model (Physicalist): Evolved cognitive model. Φ-threshold system (IIT): Integrated information.	Predictive Self / Cognitive Agent: Brain-generated hierarchical model (§6.4.3). No survival post-death.
Material Reality / Body	Jada Units / Shareer: Real, perpetual, transforming matter. Composes the body, which acts as the vehicle for <i>jeevan</i> .	Nama-Roopa / Mithya: Form and name; robust at <i>vyavahara</i> ; sublated at <i>paramartha</i> .	Physical Matter: The primary concrete reality (Physicalism); or the outer aspect of experiential units (Panpsychism).	Matter & Energy: Consolidated excitations of quantum fields. Governed by conservation laws. Perpetual in base fields.

Entity Category / Attribute	Madhyasth Darshan (Co-existentialism)	Advaita Vedanta (Non-Dualism)	Contemporary Philosophy (Process, Physicalist, Panpsychist)	Modern Science (Physics, CogSci, Cosmology)
Relationships & Moral Order	Coexistence / Complementarity: Inherent, ontologically real values (<i>mulya</i>) and orderliness (<i>vyavastha</i>).	Ethics at <i>vyavahara</i>: Valid to purify the mind; <i>loka-sangraha</i> (BG); sublated at <i>paramartha</i> .	Social / Internal Relations: Relationality constitutes the self (Process); or evolutionary strategies for survival (Physicalism).	Ecology & Cooperation: Interdependent biological networks. Cooperation is an evolved behavioral strategy.
Primary Causation	Circular mutual causality (§§1.3–1.6): <i>Satta</i> as <i>mahakaran</i> ; single <i>shram–gati–parinam</i> triad with sentient unfolding; circular activity; <i>sanskar</i> -mediated human cycles.	Vivartavada: Apparent transformation on changeless Brahman (<i>satkaryavada</i> background).	Efficient / Creative Causation: Physical mechanisms (Physicalism); or “conrescence” (Process).	Physical Causation: Mathematical laws, conservation, entropy.
Ultimate Purpose / Realization	Awakening (<i>Jagriti</i>): Realization of coexistence, leading to resolved humane conduct (<i>manaviya aacharan</i>) in society.	Liberation (<i>Moksha</i>): Recognition of identity with Brahman; illusion of separate self dispelled (VC, v. 574).	Flourishing / Adaptation: Cognitive adaptability (Physicalism); aesthetic intensity of experience (Process).	Survival & Adaptation: Natural selection; active inference / free-energy minimization (Friston 2010; §6.4.3); homeostasis.

5.5 The Sat-Chit-Ananda contrast, distributed

Advaita’s Sat-Chit-Ananda and Madhyasth Darshan’s coexistence can sound alike — both speak of being, consciousness, and fulfilment. The contrast is over what those words name and whether the world survives them.

For Advaita, *sat*, *chit*, *ananda* are three names for one ultimate reality without a second; the world is finally *mithya*. For Madhyasth Darshan, the same vocabulary is distributed across coexistence, not compressed into one subject:

Concept	Advaita Vedanta (Unified Non-Dualism)	Madhyasth Darshan (Distributed Coexistence)
Sat (Being)	Brahman alone is Sat; the world is a dependent appearance ultimately negated.	Beingness (<i>astitva</i>) is coexistence of formless Omnipresence and countless real units.
Chit (Consciousness)	Pure awareness, identical to the inner Self; the world of names/forms is inert.	Omnipresence is pervasive knowledge/condition-of-intelligibility (§1.9.4), but active sentience (<i>chaitanya</i>) belongs to the <i>jeevan</i> unit.
Ananda (Bliss)	Intrinsic nature of Brahman; sensory joy is a distorted reflection.	Harmony realized within the awakened <i>jeevan</i> , expressed as humane conduct.

The *chit* row and the DDV route sharpen a further fork. Both traditions refuse to reduce the first person to observed brain-states; both distinguish seer from seen. Advaita's *Sakshin* / *turiya*, once discriminated, is **Brahman itself** — impersonal, universal, and finally without a second knower. Madhyasth Darshan's knower is **constitutionally complete jeevan**: many distinct units, each capable of *gyan udghatan* when awakened (§1.9.5). Against physicalism the two stand together; against each other the dispute is whether irreducible awareness is one or many, impersonal ground or immortal persons-in-coexistence.

Modern philosophy has no parallel formula: it may treat experience as physical, fundamental, or illusory, but it does not name existence as Sat-Chit-Ananda or as coexistence.

5.6 Is It Possible to Map Madhyasth Darshan to Advaita?

§5.6–5.7 develop the Advaita mapping in detail.

While the two systems arise from different core commitments (Advaita: non-dualism; Madhyasth Darshan: co-existentialism), four key entities in Advaita find close analogues or functional equivalents in Madhyasth Darshan. A fifth — *Pancha Kosha* — shares Upanishadic vocabulary only; it is not a structural entity map (item 5 below).

1. Brahman corresponds to *Satta* (Omnipresence / Space)

- **Mapping:** Both are formless, all-pervasive, non-transforming, timeless, and actionless. Both serve as the ontological ground of everything.
- **Divergence:** Advaita's Brahman is the *sole* absolute reality (*paramartha*), making the world an appearance (*mithya*). Madhyasth Darshan's *Satta* coexists

with nature (*prakriti*); both are real. Brahman is awareness itself (*chit*), whereas *Satta* is actionless energy (*kriya-shunya urja*)—the condition of intelligibility—while active sentience (*chaitanya*) belongs exclusively to the *jeevan* unit (§1.9.4–1.9.5).

2. Paramatman / Atman corresponds to Atma (in Jeevan) / Jeevan

- **Mapping:** Both point to the true, immortal, non-material reality of the self. Within the five-fold structure of *jeevan*, the *Atma* represents the innermost core of realization.
- **Divergence:** Advaita holds that the true Self (*Atman*) is exactly identical to the single, universal Supreme Self (*Paramatman*). Madhyasth Darshan denies a single universal self; it holds that *jeevan* units are permanently distinct, multiple, and active.

3. Jivatman (Jiva) corresponds to Deluded Jeevan (Bhramit Jeevan)

- **Mapping:** Both represent the individual embodied self experiencing the world, bound by ignorance (body-identification), and seeking liberation or resolution.
- **Divergence:** In Advaita, the *jivatman*–*Paramatman* duality is maintained only at *vyavahara* due to conditioning (*upadhis*); upon liberation, the duality is seen to have been false — what remains is Brahman alone (VC, v. 244). For Madhyasth Darshan, individuality is ontologically real and eternal; realization (*jagriti*) resolves delusion but preserves the active, distinct individuality of the *jeevan*.

4. Jagat / Nama-Roopa corresponds to Nature / Units (*Prakriti* / *Ikai*)

- **Mapping:** Both point to the physical universe of change, bodies, name, and form.
- **Divergence:** In Advaita, the Jagat is ultimately *mithya* (dependent appearance) and sublated at the highest realization. In Madhyasth Darshan, the world of units is *satat* (perpetual) and eternally real.

5. Pancha Kosha (Five Sheaths) — terminological echo only, not a structural map

- **Shared vocabulary:** Both traditions use five-layer (*kosha*) language drawn from the Upanishads — Advaita's Taittiriya stack (*annamaya* through *anandamaya*), Madhyasth Darshan's order-and-plane exposition (*pran kosha*, *vigyanmaya*, etc.; MVD, pp. 49–50; §1.9.2).
- **Why this is not an entity analogue:** Madhyasth Darshan carries **two** five-fold structures that do not match Advaita's sheaths one-to-one. §1.9.1 names five inseparable **faculties within jeevan** — *mun*, *vritti*, *chitta*, *buddhi*, *atma* — as the inner sentient structure. §1.9.2 applies kosha terms to **developmental planes** (animal and deluded humans at four koshas; awakened humans at five including *vigyanmaya*), not to an anatomical stack parallel to *annamaya...anandamaya*. Advaita peels sheaths away to reveal the Self beneath (VC, vv. 210, 639) — not

primarily through *neti-neti* (Brihadaranyaka Upanishad). Madhyasth Darshan affirms layered human equipment to be harmonized in awakened living. The overlap is **terminological**, not ontological; listing koshas among the four structural analogues would overstate the parallel.

5.7 Unmappable Entities

Certain central entities and categories in Advaita Vedanta cannot be mapped to Madhyasth Darshan because they represent concepts that co-existentialism explicitly rejects:

1. Maya (as an Ontological Power of Projection/Concealment)

- Advaita's *Maya* is the cosmic power that conceals Brahman (*avarana*) and projects the illusion of the world (*vikshepa*). Madhyasth Darshan has no equivalent cosmic power or substance of illusion. Ignorance (*agnyan* / *bhrama*) is not a force or substance but merely the temporary cognitive absence of understanding (lack of awakening), which is resolved through study and education.

2. Adhyasa (Superimposition)

- In Advaita, the world is superimposed (*adhyasa*) on Brahman like a snake on a rope. Madhyasth Darshan has no concept of ontological superimposition. The relationship between units and *Satta* is **saturation (*samprikt*)*—a real, mutual, non-reductive co-location: inherent energy and regulation in units through saturation; uniform energy at the ground and unit-activity manifest together (§1.3; SB, pp. 57, 62, 69)—not a projection or false attribution. Do not confuse this with Madhyasth Darshan's *homonym* *adhyasa**** in the animal order — species-traditional inertial-impression accepted from gestation (§1.7; SB, pp. 62–63) — which names conduct-pattern inheritance, not ontological superimposition on Brahman.**

3. Mithya (Ontological Status of Dependent Appearance)

- Advaita introduces *mithya* (strictly *sad-asad-anirvacaniya* — neither absolutely real nor sheer nothing) to describe the world. Madhyasth Darshan rejects any intermediate ontological status: everything that exists is real, perpetual, and indestructible.

4. Ishvara (Saguna Brahman / Governor)

- In Advaita, Ishvara is Brahman associated with *Maya* — operative cause of name-form manifestation, a *vyavahara*-level category sublated at *paramartha* (VC, v. 244), not a personal creator *ex nihilo*. Madhyasth Darshan rejects **Ishvara in this sense** — a cosmic governor who plans, acts as efficient cause, or dispenses grace. That is not the same as rejecting transcendence altogether: MVD's ninth Reality set includes **"God is omnipresent, deities are many"** (proposition 5; §1.11) — *God* here names actionless Omnipresence (*satta*), while **deities are many** denies

elevating personal deities to ultimate status. Orderliness (*vyavastha*) is self-regulation (*swatah-saspurt*) inherent in the co-existing orders; *Satta* remains entirely actionless (*kriya-shunya*).

5. Kaivalya / Recognition of identity (as Ultimate Liberation)

- Advaita seeks **recognition of pre-existing identity with Brahman**, in which the illusion of separate individuality is dispelled (*jiva-brahma-aikya* — unity/identity, not merger; VC, vv. 244, 574). Madhyasth Darshan holds that individual *jeevan* units remain eternally distinct; the ultimate goal is **awakened coexistence (*jagriti*)**, where *jeevan* units remain active in harmonious relationships (*sambandh*) with other humans and the ecological orders.

The mapping attempt reveals fundamental difficulties. While surface-level analogues exist, the core ontological commitments are ultimately irreconcilable. Advaita is a world-subordinating non-dualism that views individuality and the universe as dependent appearances (*mithya*) to be transcended. In stark contrast, Madhyasth Darshan is a relational realism that affirms the eternal distinctness of sentient units and the perpetual reality of the world. Because of these profound differences, a true one-to-one mapping is impossible without distorting the foundational claims of either system.

5.8 Where the alliances fall

No single tradition wins every dispute. Three pairwise patterns clarify what each view shares with and denies to the others:

Madhyasth Darshan and Advaita against physicalism. Both refuse to treat existence as merely physicochemical matter. Consciousness, value, and the self are not exhaustively explained as brain-generated epiphenomena. Against reductive materialism, both hold that something more than bare mechanism is required — though they disagree sharply on what that “more” is.

Madhyasth Darshan and science against Advaita. Both treat the world as real and worth studying. Matter, bodies, relationships, and ecological order are not finally *mithya* or preparatory illusion. Against world-negating non-dualism, both insist that nature and society have final weight — though science does not affirm Omnipresence or immortal *jeevan*.

Advaita and science against Madhyasth Darshan. Both set a high bar for claims that exceed public evidence. Advaita holds that separate individuality was never ultimately real (VC, v. 574); science treats the self as a biological process that ceases at brain death. Against Madhyasth Darshan’s eternal distinct sentient units, both deny — on different grounds — that an immortal individual self is established.

Each pair agrees on something the third denies. Comparative clarity depends on naming which question is at stake: matter-only reduction, world-reality, or individual immortality.

6. Critical Review

6.1 Internal coherence of the Madhyasth Darshan position

Judged on its own definitions — not as proof against rivals — the ontology hangs together in several ways:

1. **The ontology is internally unified.** Coexistence, real units, and beginninglessness hang together without separate doctrines for each question (§5.1 maps the cross-tradition contrast).
2. **It avoids world-negation.** “Brahma is truth, the world is perpetual” preserves the reality of nature, society, relationship, and ethical responsibility.
3. **It avoids simple material reductionism.** It refuses to treat consciousness, value, and selfhood as mere byproducts of body-chemistry.
4. **It links ontology and conduct.** If existence is coexistence, human fulfilment must be evidenced as coexistence in behavior, not merely believed.
5. **It is conservation-based for coexistence and transformation.** “Nothing existent is annihilated” gives internal coherence to *vastu* persisting through *roop*-change, bodily death as configuration-shift, and development within beginningless coexistence. Post-death continuity of *this jeevan* is a further metaphysical commitment, not a theorem of quantity conservation alone (§1.10, §6.2.4).

These are strengths **within** the system’s premises. They do not by themselves establish those premises against Advaita or physicalism (see §6.2–§6.6).

6.2 Open problems for Madhyasth Darshan

The items below are numbered **6.2.1–6.2.10** for cross-reference. They group under internal coherence, evidence and science, and comparative philosophy.

6.2.1 The emergence of sentience

Madhyasth Darshan holds that an insentient atom, through development, reaches constitutional completeness and becomes sentient *jeevan* (SB, pp. 55, 59). That account uses threshold grammar — a quantitative stability producing a qualitative register of active sentience — which can sound like strong emergence. Yet the paper also borrows Strawson’s anti-emergence principle against physicalism (§3.3). The darshan’s resolution is **latency**: sentience is eternally present through coexistence in *satta* as *gyan* and is **actualized** at constitutional completeness, not created from nothing (SB, p. 59; §6.6). What remains open is the detailed physical mechanism of the Saturation-Reflector Model and whether latency can be stated in fully formal terms.

6.2.2 Mutual dependence and the Nagarjuna challenge

Madhyasth Darshan holds that inherent energy in units and manifestation of uniform energy as activity are inseparable through saturation — **mutual dependence for manifestation** (this paper’s shorthand for the reciprocal structure in SB p. 62 and MVD p. 40), not one-way physical supply (§1.3). Without unit activity (*basic impulsion*), uniform energy at the ground remains unmanifest; without saturation, there is no basic impulsion (SB, p. 62; MVD, p. 40). SB’s identity-chain treats each link as “itself is,” not as external push — yet the chain still binds ground and unit: forcefulness, impulsion, activity, and development are readable only through saturated units. Nagarjuna’s critique of *svabhava* (intrinsic existence) is potentially the **most serious philosophical threat** to this system, because Madhyamaka asks whether anything that exists only through mutual dependence can exist **from its own side** at all.

What Madhyamaka presses. In the *Mulamadhyamakakarika*, Nagarjuna argues that what possesses *svabhava* would exist independently — not produced by causes, not dependent on conditions, not conceptually constructed. Dependent origination (*pratityasamutpada*) is the obverse: whatever arises dependently lacks such intrinsic nature and is **empty** (*shunya*) of *svabhava*. The critique is not merely that things have causes; it is that **dependence and intrinsic existence are incompatible**. Applied to Madhyasth Darshan: if *satta*’s uniform energy is manifest only through unit-activity, and unit activeness is readable only through saturation in *satta*, a Madhyamaka reader may conclude that neither pole is independently real — precisely the reduction to dependent co-arising without enduring units that coexistential realism must resist. Beginninglessness does not automatically block that inference. Eternal co-dependence can still be co-dependence: what never began can still lack *svabhava* if its being is wholly relational.

Where the pressure lands in Madhyasth Darshan. The vulnerability is structural, not a single misquoted sentence. Saturation is the first relational layer of coexistence; *sambandh* among units is the second (§1.4). Every unit carries form, properties, **essential nature** (*svabhav*), and *dharma* (§1.2) — a definite signature that participates in orderliness. Conservation holds that *vastu* is not annihilated (§1.10). Immortal *jeevan* units are functionally indivisible individuals (§1.8–1.9). All of this speaks the language of **enduring particulars with natures**. Madhyamaka’s *svabhava* and Madhyasth Darshan’s *svabhav* are not the same technical term — the latter names order-specific essential nature, not Buddhist intrinsic existence — but the English collision is not harmless: a reader trained in Garfield’s or Westerhoff’s Madhyamaka will hear “inherent energy,” “essential nature,” and “indestructible unit” as claims of the very intrinsic status Nagarjuna targets.

The implicit Madhyasth reply — and its limits. The texts’ answer, never framed as a reply to Buddhism, rests on several commitments that must be distinguished:

Dependence type in the primary texts. The texts do not use the formula “dependence for manifestation versus dependence for existence,” but the distinction is anchored in what they assert. MVD p. 40 brackets the reciprocal revelation claim with eternal co-presence — “Nature is eternally present in absolute energy” — so matter is not said to arise when energy

is revealed; units are already there *in* absolute energy while remaining reciprocally required for its appearance as activity. JV p. 18 states that there is “no provision in existence to separate units of nature from Omnipresence,” treating saturation as structurally provisioned rather than contingent mutual reliance. MVD p. 13’s Reality propositions — “the world is perpetual” (*jagat satat*), many *jeevan*-clouds, immortal *jeevan* — refuse demotion of units and world to mere conventional designation. These passages support reading SB p. 62 / MVD p. 40 reciprocity as dependence for **revelation**, not for ontological absence of either pole; they do not constitute an explicit reply to Nagarjuna.

1. **Co-eternal co-presence, not derivation.** *Satta* and units are “inseparably present” from the outset (SB, p. 48; MVD, p. 11, 40). Neither is produced from the other; neither is ontologically posterior. Mutual dependence for **manifestation** is not temporal emergence from non-being — the pattern §1.10 denies for existence as a whole.
2. **Asymmetric roles within inseparability.** Omnipresence is *sthitipurn* (state-complete): non-transforming, actionless, without motion or pressure (SB, pp. 50, 68–69). Nature saturated in it is *sthitishil* (state-dynamic): units whose activity constitutes all change. *Satta* is *mahakaran* — supreme cause in the **sustaining** sense, not the efficient trigger of particular change (§1.6). The poles are mutually dependent for how energy appears, but not interchangeable: one is formless ground, the other is formful activity.
3. **Countably many reals, not mode-monism.** MVD’s second Reality proposition pairs omnipresent Brahma with **many** *jeevan*-clouds (MVD, p. 13). Units are bounded, countable, and saturated — not modes of a single substance expressing one nature (contrast Spinoza, §3.4). Madhyasth Darshan’s plural *ikai* are ontological partners of *satta*, not appearances on a one-sided ground.
4. **Definite relationships and value.** Units stand in *sambandh* with predetermined expectations toward completeness (MVD, p. 62). Recognition, fulfilment, and essentiality-as-value (§1.4) treat nature as a structured moral-ontological order, not a flux of dependently arisen events with no final weight.

Taken together, these commitments sketch a **coexistential realism**: ground and units are eternally co-present, asymmetrically related, plural, and law-governed. That is not Advaita’s world-negating non-dualism and not Buddhist process reduction — but whether it survives Madhyamaka is a separate question. A Madhyamaka philosopher can accept co-eternality and asymmetry yet still ask: if each pole lacks manifestation without the other, what **positive ontological status** remains beyond relational role? Madhyasth Darshan answers “real coexistence” — *saha-astitva* as beingness and indestructibility — but has not yet shown that this answer meets the *svabhava* argument on its own terms.

Anatta as the sharper flank. Saturation mutual dependence threatens the **ground–unit structure**. Buddhist **anatta** threatens the **individual self** more directly (§5.4). If what we call *jeevan* is a dependently assembled, impermanent aggregate, constitutional completeness and post-death continuity (§§1.9–1.10, §6.2.4) fail regardless of how saturation is parsed. Madhyasth Darshan holds that *jeevan* is a real, immortal, constitutionally complete atom —

not a conventional designation for changing aggregates. The Madhyamaka challenge and the anatta challenge converge on immortal individuality but diverge in mechanism: one attacks intrinsic existence through dependence, the other through diachronic decomposition. A full response to §6.2.2 must address **both**.

Pressure	Madhyamaka question	Madhyasth Darshan implicit answer	Still open
Saturation	Can ground and unit be real if each manifests only through the other?	Co-eternal co-presence; asymmetric sustaining vs active roles	Whether co-eternal mutual dependence avoids emptiness of <i>svabhava</i>
Unit signature	Are form, <i>svabhav</i> , and <i>dharma</i> intrinsic natures?	Order-specific essential nature in mutuality, not isolated substance	Terminological and philosophical bridge to Buddhist <i>svabhava</i>
<i>Jeevan</i>	Is there an enduring self?	Functionally indivisible, constitutionally immortal sentient atom	Anatta tradition denies what MD asserts without shared proof
Conservation	Does persistence entail intrinsic identity?	<i>Vastu</i> conserved through <i>roop</i> -change; <i>jeevan</i> continuity across bodies	Category error risk (§6.2.4) if conservation is read as entity-proof

Lines a future defense would need to develop. None of the following is established in the primary texts as an explicit anti-Madhyamaka argument; they are the most promising directions for rigorous work:

- **Dependence type.** Distinguish dependence for **manifestation** (how uniform energy and activity appear together) from dependence for **existence** (whether a pole could be absent). Madhyasth Darshan appears to deny the second while asserting the first — with MVD p. 40's bracketing clause, JV p. 18 on non-separability, and MVD p. 13 on world-perpetuity and plural *jeevan* as the primary textual hooks. A formal account must still show that distinction is principled, not verbal, to Madhyamaka standards.
- **Two-level realism without world-negation.** Advaita uses *vyavahara* robustness while sublating at *paramartha* (§2.1). Madhyasth Darshan refuses that sublation — *ja-gat satat* (MVD, p. 13). A Madhyamaka-informed defense cannot simply borrow Advaita's two truths; it must explain how units retain **final** weight while lacking Buddhist *svabhava*, or else revise the ontology.
- **Law of coexistence vs bare co-arising.** The texts treat development, awakening, and relationship-recognition as **provisioned and definite** (MVD, pp. 5, 61, 77) — not arbitrary reconfiguration. If emptiness is compatible with conventional order, Madhyasth Darshan needs to show its laws are the conventional structure Madhyamaka

can accept **without** demoting units to mere designation — or argue that Madhyamaka's conventional level is too thin for MD's relational realism.

- **Individual immortality.** Functional indivisibility of *gathanpurna parmanu* (§1.8) is the load-bearing reply to aggregate reduction. That case must be made independently of saturation prose and tested against Buddhist analyses of personhood.

Until those lines are developed, Nagarjuna's challenge belongs at the **center** of the open-problems list. Mutual dependence in §1.3 is not a decorative metaphor; it is the hinge on which coexistential realism meets Madhyamaka emptiness. Formal work on latency and the law of coexistence (§6.6) cannot be complete without this engagement. Madhyasth Darshan's implicit reply rests on co-eternal asymmetric co-presence and plural enduring units — not on denying mutual dependence outright — yet that reply remains an open defense, not a settled answer to Madhyamaka on its own terms.

6.2.3 *Satta-ikāi* relation and circular causality

§1.3–1.6 state mutual dependence and the single effort–motion–result triad with its sentient unfolding in prose; what remains is formalization — not discovery of whether the texts assert them. Unit cardinality is read as practical uncountability throughout (§1.7). What remains to formalize here is mutual dependence, the effort–motion–result triad, and circular causality in prose — not a plurality whose scale is mathematically infinite.

6.2.4 Mereology, identity, conservation inference, and rebirth

Category error first: JV p. 20 is the system's most empirically exposed inference — post-death survival and re-association of *jeevan* from “nothing is annihilated.” From the standpoint of modern science, this inference conflates **conservation of quantity** with **conservation of structure (or entity)**: physics conserves mass-energy and charge, but not specific configurations or functional identities. Thermodynamic and field-theoretic conservation alone do not guarantee the immortality of a structured unit like *jeevan* unless *gathanpurnata* is already assumed as a separate metaphysical axiom. §1.10 separates coexistence conservation from *jeevan* persistence and rebirth; the friction with particle physics is whether a **particular composite configuration** — once constitutionally complete — is immune to decay or decomposition, when composite bound states in physics are not absolutely indestructible. That is the weakest inferential link for post-death survival and transmigration and should be weighed accordingly.

The *gathanpurna parmanu* at issue is **not** an elementary particle in the sense of modern physics. MVD treats every atom as a **composite**: its kind, state, and measure are fixed by the number of particles in its nucleus and its orbiting dependent particles (MVD, p. 42); constitutional completeness is reached when the required number of such particles is integrated into a stable compound configuration (SB, pp. 55, 59; §1.8). Madhyasth Darshan reads *jeevan*'s “indivisibility” as **functional** — a self-maintaining constitution that does not spontaneously lose completeness — not as the claim that *jeevan* has no parts (§1.9). Identity is continuity of that constitution across death and re-association (§1.9–1.10).

6.2.5 Jeevan–body interaction

If *jeevan* is a constitutionally complete atom that **drives** the body, physicalist readers face an interaction problem as old as Descartes. Either *jeevan* exerts physical force on neural and muscular tissue — in which case the interaction should be measurable in principle, and constitutional completeness should be operationalizable, contradicting §6.2.7 — or it does not exert physical force, in which case “drives” must name a non-mechanical mode of influence that the texts have not specified.

What the primary texts do say. Humans are a **joint form** of *jeevan* and body; the body is medium and instrument, not the sentient self (§1.9.1; MVD p. 13). MVD’s four-level causal hierarchy places *atma* within *jeevan* as **causal** level — gross body, subtle atoms, causal *atma*, supreme cause *satta* (MVD, pp. 288–289) — so intention is not modeled as a separate substance pushing neurons from outside. MVD p. 115 describes vibrational motion on the brain from the cognitive organs leading to knowledge-unfolding (§1.9.5) — a pathway description within the human as joint form, not a proof of physical causal closure.

What the primary texts do not settle. Whether *jeevan*’s “driving” **violates physical causal closure** or names **non-mechanical influence within** the effort–motion–result activity already attributed to the human as joint form. No passage in this study’s corpus commits to measurable extra physical force **or** to epiphenomenal accompaniment. The system **appears** to take the second horn in spirit — hierarchical unit-causation within coexistence, not Cartesian push — but closure relative to modern physics remains **open in the primary sources**, not only in this paper.

This gap is **under-weighted** relative to how often “works through the body” appears as load-bearing ontology. Full treatment belongs in the planned *Philosophy-Of-Mind-And-Jeevan* study; here the point is to name the horn the darshan seems to intend and mark the source-level silence on closure explicitly.

6.2.6 Provisioned structure vs deluded default

§1.9 states provisioned *drishti*, inherent orderliness (MVD, pp. 5, 14–15), and the gap between necessary humane refuge and deluded lower refuge (MVD, p. 67). What remains is fuller treatment at the intersection of ontology and conduct — especially how subordination of *priya–hita–labh* under *nyaya–dharma–satya* becomes lived reorganization rather than abandonment ([Ethics-And-Morals-In-Human-Beings](#) §3.2).

6.2.7 Constitutional completeness is not operational

Central to the ontology but not presently measurable in physics or chemistry.

6.2.8 Evidence standard vs. science

Realization and behavior are cited; science requires public testability. What would count as evidence for *jeevan* beyond the hard-problem explanatory gap? §6.4 addresses this. An explanatory gap in the hard problem is not by itself an existence proof for *jeevan*; physicalists

treat it as philosophically non-decisive while Madhyasth Darshan reads it as ontological incompleteness in matter-only accounts (§3.2, §6.2.1). Comparisons with physics use **consonant with, parallel to, or in tension with** — not “supported by” unless the evidence warrants it; conceptual resonance with beginningless cosmological models is not proof of perpetual nature (*satat*) (§4.2). Claims about individual immortality and constitutional completeness remain distinct metaphysical assertions beyond what current science validates.

6.2.9 “Knowledge but not knower”

Madhyasth Darshan calls Omnipresence *gyan* while denying it the activity of knowing; active *gyan udghatan* belongs only to awakened *jeevan* (§1.9.5). The positive ontological account of *gyan* as intelligibility-ground is §1.9.4; comparative work must not collapse that ground into Advaita’s *chit* (Brahman as awareness itself) — a misreading the English translation’s “Consciousness” label encourages (Editorial Notes). Epistemic machinery (*gyan-vivek-vi-gyan*, evidence) belongs in [Knowledge, Knower, and Known](#).

6.2.10 The nature of time

This paper states Madhyasth Darshan’s core claim — *kaal* as duration of activity, not independent substance; timeless *satta*; numerical reckoning within existence. Past/present/future structure, JVD on “activity eternally present,” and comparison with Advaita *trikaal* language, McTaggart, eternalism/presentism, and spacetime physics are developed in [Nature-Of-Time](#); residual open problems remain in that study’s §6.

6.3 Strengths and Limits of Advaita

Advaita has a powerful answer to non-being (existence cannot arise from non-existence, CU 6.2.2) and a rigorous first-person method — DDV’s seer-seen discrimination and MU’s three-state analysis (§2.1–2.2). Its ontology is also **parsimonious**: one partless Brahman, without a second ground, without plural immortal substances, without a separate cosmic power of illusion standing alongside the absolute. Against Madhyasth Darshan’s coexistence of *satta*, countless *ikai*, definite *sambandh*, and latency at *gathanpurnata*, Advaita compresses existence into a single subject whose empirical multiplicity is finally sublated.

Its limit, from the Madhyasth perspective, is that making the world *mithya* at *paramartha* makes it harder to ground the **final** ontological weight of relationships, nature, society, and conduct — even though *vyavahara* is robust, shared, and law-governed (§2.1). Nagraj’s native objection, framed against the Vedanta he inherited, presses this point from origination:

“According to Vedanta knowledge, only Brahma is the truth, and this world is an illusion (‘Brahma satya, jagat mithya’). However, jeeva and jagat are said to have originated from Brahma.”

- MVD, *The Alternative*

“How can the jeeva and jagat, which originated from the Truth, Knowledge, and Infinite Brahma, be an illusion?”

- MVD, *The Alternative*

Madhyasth Darshan’s counter-slogan — *Brahma is truth, the world is perpetual* (MVD, p. 13; §1.11) — is not mere rhetoric. If *jeeva* and *jagat* arise from Sat-Chit-Ananda Brahman through *satkaryavada*, treating them as finally *mithya* looks internally unstable: the effect would be less real than a cause whose nature is being, consciousness, and bliss. Advaita’s reply is the three-tier distinction and *vivartavada*: name-form is dependently real at *vyavahara* and sublated only at *paramartha*; the clay-pot is not nothing, but its separateness from clay is (VC, v. 251; §2.1). That reply is coherent **within** Advaita; Madhyasth Darshan denies that sublation is the last word on the world.

Advaita’s fair reply to world-negation is substantial and should not be dismissed in a sentence. At *vyavahara*, ethics and compassion remain fully valid; realization of non-duality deepens rather than weakens them. Shankara’s *Vivekachudamani* insists on ethical discipline as prerequisite to knowledge (VC, vv. 17–19). The Bhagavad Gita, in Shankara’s commentary, grounds social responsibility in *loka-sangraha* — holding the world together — and ordained duty (*niyatam kuru karma*, BG 3.8): the enlightened still act for the welfare of the world. Advaita can therefore reply that *mithya* does not make ethics untenable: ethics is binding at the level where life is actually lived. *Vyavahara* is also **beginningless** in the classical cosmology — creation and dissolution cycle without a first moment — so the empirical world is not a fleeting illusion in the manner of a private error (*pratibhasika*).

The Madhyasth counter-reply is narrower but precise. Beginningless *vyavahara* and robust ethics do not settle **final** ontological status. *Satat* (*perpetual*) names a world that retains full weight at the highest realization — relationships, nature, and *mulya* are not ultimately sublated (§5.7). An ontology that makes the world *mithya* at *paramartha* cannot give the world the same final weight coexistence gives it. This is a genuine disagreement about whether *vyavahara*’s robustness suffices for Madhyasth Darshan’s standard of world-realness, not a defeat of Advaita on its own terms.

Madhyasth Darshan’s exposed point against Advaita’s parsimony is the **cost of plurality**: many immortal *jeevan* units, saturation mutual dependence, and tiered *gyan/chaitanya* buy relational realism at the price of ontological complexity Advaita refuses. Whether that cost is justified is part of what §6.2.2 and §6.5 leave open; Advaita’s cost is world-subordination at the highest truth. Neither system is free of trade-offs.

6.4 Strengths and Limits of Modern Approaches

Modern approaches are strongest where Madhyasth Darshan is weakest: public evidence, empirical correction, cognitive modelling, precise mechanism. Self-model theory explains many features of embodied selfhood without an eternal *jeevan*; illusionism shows how a naturalist can reinterpret even the apparent obviousness of experience.

But modern philosophy is not unified. Chalmers and Nagel show experience resists reduction; Strawson shows some physicalists move toward panpsychism. It is inaccurate to say “modern philosophy has proved the self is only the brain.” What modern philosophy **has** established is a high evidential bar: an explanatory gap is not an existence proof for *jeevan*.

What would count as evidence? Public science would require at minimum: (a) operational criteria for constitutional completeness independent of the philosophy; (b) reproducible markers distinguishing *jeevan*-mediated from brain-only activity; (c) independent evidence for post-death continuity of a sentient unit. Until then, Madhyasth Darshan’s claims about immortal *jeevan* remain metaphysical assertions compatible with coexistence conservation but not validated by current science — while the hard problem shows physicalism’s own exposed point (§3.2).

6.4.3 Physicalism’s strongest reply: predictive processing

Physicalism’s most developed recent reply to ontology-of-self challenges is not illusionism alone but **predictive processing** and **active inference**: the brain as a hierarchically deep generative model that minimizes prediction error (surprise) by updating beliefs and guiding action (Friston 2010; Clark 2016). On this view, valuation, aspiration, the sense of being a continuous self, and the felt reality of the world are not dismissed as mere illusion; they are **functionally real control structures** — layered expectations that keep the organism viable. Seth (2021) extends the picture: conscious selfhood is the brain’s “best guess” about its own embodiment, a controlled hallucination tuned by interoceptive and sensorimotor evidence.

That reply deserves the same seriousness as Advaita’s *loka-sangraha* defense in §6.3. It meets Madhyasth Darshan partway on embodiment, circular causation, and the reality of regulation in lived experience. It is a harder opponent than bare eliminativism because it does not treat first-person structure as a mistake to explain away.

The Madhyasth counter-reply is narrower. Predictive models explain **how** a body self-regulates and represents its situation; they do not settle **whether** the regulator is only neural tissue or a distinct constitutionally complete unit working through the brain. Latency holds that sentience is actualized from coexistential ground at *gathanpurnata*, not generated as a new experiential ingredient from dead matter (§6.6). Until public criteria distinguish those ontologies, the dispute remains at the incommensurability boundary (§6.5) — not settled by predictive accuracy alone.

6.5 Epistemology: partially incommensurable criteria

Given the standard of success set in Standpoint and scope, the three systems do not merely give different answers; they use different criteria for what counts as knowing:

Tradition	Method	Adequate for
Madhyasth Darshan	Study, realization, behavior, experiment	Coexistence as lived evidence; conduct as proof of understanding
Advaita	Scripture, reasoning, contemplative discrimination (DDV, VC)	Self as Brahman; sublation of <i>mithya</i>
Physicalism	Observation, modelling, public evidence	Mechanism, prediction, third-person confirmation

To that extent they are **partially incommensurable** — no single neutral tribunal settles them. Against that background, this paper tests each tradition for internal consistency, fit with public knowledge, and responsible distinction of posits from bare assertion. The epistemic standards of realization as proof are examined in [Knowledge, Knower, and Known](#).

6.6 Latency and the Saturation-Reflector Model

§1.3 established saturation — units surrounded, soaked, and sustained in Omnipresence. §1.9.4 distinguished *gyan* as intelligibility-ground from active knowing in *jeevan*. §1.8 traced constitutional completeness — when a composite atom becomes sentient *jeevan* (*gathanpurnata*) — and named the stable atom-configuration at that threshold a **mediating configuration** (the source texts call it a reflector). The Saturation-Reflector Model states how ever-present *gyan* in *satta* reaches active sentience (*chaitanya*) at that threshold without strong emergence from dead matter.

Madhyasth Darshan does **not** solve the hard problem of consciousness in the physicalist's sense. Sentience is eternally present in coexistence and **actualized** at constitutional completeness rather than produced from non-experience; the **Saturation-Reflector Model** is the darshan's load-bearing statement of that reading — but it **relocates** the problem rather than discharging it. Instead of asking why experience arises from wholly non-experiential matter, the system now owes two further questions: **(a)** why a constitutionally stable atom-configuration channels ever-present *gyan* into active *chaitanya* rather than remaining at the orderliness tier only (**selection**), and **(b)** what makes *satta* as *gyan* the experiential ground at all (**grounding**). Latency converts an emergence problem into a selection problem and a grounding problem; neither is settled in this paper.

Madhyasth Darshan reads constitutional completeness through **latency**: sentience is eternally present in coexistence and **actualized** at *gathanpurnata*, not produced from non-experience. Building on §1.3's saturation and §1.9.4's account of *gyan* as intelligibility-ground, the Saturation-Reflector Model is the darshan's canonical statement of that reading (consti-

tutional completeness in §1.8). In analytical prose this paper uses **mediating configuration** for the stable atom-structure at constitutional completeness; the source texts call it a **reflector** (*pratibimba* register in SB’s saturation language). The English word is retained where the texts use it; it should not be read as optical bounce.

Textual basis for latency

SB p. 59: all atom types, including constitutionally complete ones, are “eternally present through the natural law of coexistence.” Sentience is not created at completeness; it is actualized. SB p. 55: at completeness, particle count is fixed; change is qualitative without quantitative addition — not the arrival of a new experiential ingredient from non-experience.

Selectivity: why only *gathanpurna parmanu*?

Satta is all-pervasive; every unit is saturated. Pervasiveness does not entail universal **active** sentience. Saturation provisions inherent orderliness and energy in all units (SB, pp. 57, 69; §1.3); insentient units exhibit radiance and projection only. Active *chaitanya* appears when a constitutionally **stable** configuration — fixed particle count, self-maintaining completeness, inexhaustible force at the sentient threshold (SB, pp. 55, 59) — acts as the **mediating configuration** through which ever-present *gyan* reaches the knowing register.

The texts tie selectivity to **constitutional stability** — functional indivisibility and qualitative change without further quantitative addition — not to integration (IIT’s Φ), metabolic closure alone (autopoiesis), or mere compositional size. The principled reason, within the darshan, is developmental: sentience is the **evidence** of constitutional completeness at the atomic threshold of Development Progression through the physicochemical complex (MVD, p. 76; SB, p. 59), not an independent property bolted onto matter. That is textually grounded but **not independently defended** against rivals who tie consciousness to information integration, biological self-production, or neural dynamics. A skeptical reader can accept saturation and still ask why particle-count stability is the sentience-relevant threshold rather than some other structural invariant. Comparative threshold accounts are tabulated below; what Madhyasth Darshan adds is latency in *satta*, not a third-person metric.

Answering the physicalist “emergence” objection

Digestion, weak emergence, IIT, and self-models share **threshold grammar** with *gathanpurnata* — potential organized one way, a qualitative register appears at a structural condition. Latency-at-a-threshold is structurally close to what IIT and weak emergence do; the disanalogy is what the threshold **actualizes**:

Rival account	What the threshold does	Experiential ground
Digestion / weak emergence	New function from chemistry	None; organization only

Rival account	What the threshold does	Experiential ground
Self-model / predictive processing	Regulative model from neural dynamics	None; representation only
IIT	Consciousness from integrated information (Φ)	Experience tied to information structure
Saturation-Reflector (MD)	Active <i>chaitanya</i> from ever-present <i>gyan</i> in <i>satta</i>	Coexistential intelligibility-ground; latency

Madhyasth Darshan therefore does not treat sentience as strong emergence from dead matter. It treats sentience as **latency actualized** through a mediating configuration — consistent with Strawson’s anti-emergence principle (§3.3) while restricting active sentience to constitutionally complete atoms, not every particle. Strawson’s combination problem (§3.3) presses panpsychism; Madhyasth Darshan’s reply is that *jeevan* is already one constitutionally complete unit, not an assembly of micro-minds — but that reply still leaves the threshold itself as the locus of unresolved selection and grounding.

Madhyasth Darshan and panpsychism share a deeper **grounding commitment**: experientiality — here as *gyan* / intelligibility-ground in *satta* — is primitive, not derived from wholly non-experiential matter. They **differ in distribution**: not every particle is a subject; only *gathanpurna parmanu* actualizes active *chaitanya*. The combination-problem escape in §3.3 is therefore **scope-relative**, not a discharge of the grounding posit. A physicalist can still read latency as panpsychism with selective actualization — proto-experience in *satta* rather than in particles, but experientiality-as-fundamental nonetheless.

Self-model and predictive-processing theories explain hierarchical regulation; they do not by themselves refute latency, because latency does not deny embodied regulation — it locates the sentient **unit** that works through the body.

What remains open

The model is a metaphysical framework, not a detailed physical mechanism. It does not answer physicalism’s demand for third-person public evidence (§6.4), nor does it reconcile the claimed constitutional immunity of the composite *gathanpurna parmanu* with modern particle physics — where composite bound states decay rather than elementary particles being indestructible (§6.2.4). The hard problem is **asserted away** only in the weak sense that latency denies experience-from-nothing; it is **not solved** in the strong sense until selection and grounding are independently motivated and the Nagarjuna challenge (§6.2.2) is answered.

Latency therefore relocates emergence into selection and grounding problems; rival accounts share threshold grammar with constitutional completeness, but only the Saturation-Reflector Model actualizes coexistential *gyan* rather than chemistry, information, or neural dynamics

alone. Formalizing that reading within the law of coexistence — and defending it against Nagarjuna's *svabhava* critique — is the most promising route for later rigorous work.

7. Conclusion

Madhyasth Darshan answers the paper's framing questions — what existence is, what exists, whether what exists begins, whether *jeevan* persists, and whether the world is finally real — through a single ontological picture. **Existence** (*astitva*) is eternally present **coexistence** (*saha-astitva*): formless Omnipresence (*satta*) and countless sentient and insentient **units** (*ikai*) inseparably present together — neither made from the other, neither finally cancelled. **What exists** is that whole: the all-pervasive, actionless ground in which every unit is saturated (*samprikt*), carrying inherent energy and regulation through that relationship, together with the units themselves in their real form, properties, *dharma*, and **definite relationships** with one another. Saturation is the ontological relation between ground and units — not physical extraction from *satta*; *sambandh*, complementarity, and value-fulfilment are the ontological relations among units; complementary units compose into tiered assemblies from particles through societies (§1.5). **What exists does not begin** from non-existence (*ab-hava*): coexistence is beginningless; *satta* does not transform; units are not annihilated, though bodies, configurations, and associations do begin and end. Time (*kaal*) is the duration of unit-activity, not an independent cosmic container (§1.6).

Within this frame, **causation** is circular and order-specific, not creation from nothing. Omnipresence is *mahakaran* — the sustaining ground — not the efficient cause of particular change; the work of transformation belongs to units. All nature moves through effort–motion–result (*shram–gati–parinam*); in sentient *jeevan* the same triad is read toward constitutional, activity, and conduct completeness through projection, reflection, and *samadhan* (§1.6). Sentience is the status of a constitutionally complete atom (*gathanpurna parmanu*), eternally present in coexistence and actualised at completeness rather than produced from dead matter (§§1.6–1.8, §6.6). Every unit is active and developing **solely for completeness** (§§1.8–1.9): recognising and fulfilling the relationships provisioned in coexistence through **capacity, ability, and receptivity** (*kshamata, योग्यता, पारता*) at the level of its order (§1.4) — Development Progression through the physicochemical complex reaching *gathanpurnata*; Awakening Progression in *jeevan* activating provisioned *drishti* toward activity and conduct completeness (§1.9). Nature develops through real plateaus — material, bio, animal, and knowledge orders — each with its own *dharma*. In the human order, **awakening** (*jagriti*) is completeness-driven relationship-recognition and value-fulfilment becoming explicit through *sanskar*, study, environment, and realization — until knowledge unfolds through the active *jeevan* and becomes evident as resolved humane conduct (*manaviya aacharan*) in relationship with other humans and the ecological orders.

“Brahma is truth, the world is perpetual.”

- MVD, p. 13

That formulation marks what is distinctive in comparative terms. Against **physicalism**, Madhyasth Darshan refuses matter-only reduction: consciousness, value, selfhood, and ethical relation are not exhaustively explained as brain-generated epiphenomena, yet the world of units remains fully real for study and responsibility — not a second-class appearance. Against **Advaita**, it refuses world-negation at the highest level: the perpetual world (*jagat satat*), distinct immortal *jeevan* units, and ontologically real relationships and values (*mulya*) retain final weight; coexistence is not compressed into a single subject whose empirical multiplicity is finally *mithya*. Against both, it holds a **relational realism**: Brahma is real, the world is real, and their inseparable presentness is coexistence — with ontology tied to conduct, so that understanding is fulfilled when coexistence becomes clear in one’s own seeing and evident in humane living, responsible work, and experiment. The pairwise patterns in §5.8 show where each tradition agrees and diverges on these stakes; the critical review in §6 examines what remains open within and against that position.

Editorial Notes

Translation and editorial conventions (*satta*)

The source texts’ primary English term for the all-pervasive, formless reality (*satta*) is **Omnipotence**; *vyapak* (“all-pervasive”) is rendered “Omnipresence” in the English translation. The English translation alternates **Omnipotence** and **Omnipresence** for the same *satta*; Hindi *satta* is the constant behind both. To avoid the theistic connotations of “Omnipotence,” this paper uses “**Omnipresence**” as its running English term in analytical prose. Block quotes preserve whichever word the translation prints. Where Hindi *shunya* appears, the translation renders it **Space** — void/emptiness (actionless, formless), not physical *akasha*.

“Consciousness” in SB p. 48

The English translation lists several names for the pervasive reality (*Satta / Vyapak*): Uniform Energy, Space (*akasha*), Knowledge (*gyan*), Consciousness, Omnipresence, Eternity, God, and Absolute Energy. In SB p. 48, the parenthetical “(consciousness)” labels the all-pervasive reality, not a personal knowing mind. Sentience as the activity of a knower (*chaitanya*) is the status of *jeevan* (the sentient unit), not of Omnipresence (*satta*) itself. This distinction is essential; the comparative risk of collapsing *satta-as-gyan* into Advaita’s *chit* is addressed in §1.9.4 and §6.2.9.

Naming tensions for *satta*

The source gives *satta* multiple English names. Several generate internal tensions if treated as interchangeable:

Name	Tension
Knowledge / Consciousness	Implies cognition — yet <i>satta</i> is denied as knower (§1.9.5).
Space / <i>Shunya</i>	Void/emptiness vs. fullness of energy; <i>shunya</i> is rendered “Space” in the English translation, not physical <i>akasha</i> .
God	Personhood vs. actionless, non-willing <i>satta</i> .
Absolute Energy	Dynamism vs. <i>kriya-shunya</i> (actionless).
Uniform Energy, Eternity	Listed alongside the names above; no single English label captures all aspects.

The source does not fully settle how these names cohere as one reality.

Madhyasth Darshan *svabhav* and Buddhist *svabhava*

Anglophone readers trained on Madhyamaka will hear Madhyasth Darshan’s **essential nature** (*svabhav*) and hear Buddhist **intrinsic existence** (*svabhava*) — the same English stem, different technical terms. That homonym does real damage: “inherent energy,” “essential nature,” and “indestructible unit” can sound like precisely the intrinsic status Nagarjuna targets (§6.2.2).

In Madhyasth Darshan, *svabhav* names **order-specific essential nature** — how a unit’s properties participate in mutuality and maintain balance among the four orders (§1.2). In Madhyamaka, *svabhava* names existence **from its own side**, incompatible with dependent origination. Read the essential-nature table in §1.2 with that distinction in mind; the Madhyamaka engagement belongs in §6.2.2, not in a casual identification of the two terms.

Advaita: *mithya* and *sad-asad-anirvacaniya*

The *mithya* doctrine and Advaita’s three-tier framework (*pratibhasika*, *vyavahara*, *paramartha*) are related but distinct tools; §2 keeps them apart. The compound *sad-asad-anirvacaniya* is a post-Shankara systematic term (Vimuktatman, Vivarana school); Shankara uses “neither sat nor asat” language without that compound.

Advaita: *Vivekachudamani* as source

This study cites the *Vivekachudamani* (VC) heavily for accessible verse formulations of discrimination, ethics, and liberation. VC is a devotional *prakriya* (method) text traditionally attributed to Shankara; modern scholarship treats that authorship as uncertain. The Upanishads, *Mandukya*, and DDV supply the exegetical core; VC supplies pedagogical compression. Claims tied to VC should be read as standard Advaita teaching in that genre, not as a substitute for Brahma Sutra commentary on disputed points.
