

Research Note: A Control-System Model of *Jeevan—Bal, Shakti, and Activity*

Author: Raghava Mohan Madhwapathi (analyticmadhyasthdarshan.org)

Edited on: August 12, 2026, 9:42 PM IST

Status: Internal research note (not a catalog entry). Compiled to support [The Epistemology of Coexistence](#), especially its account of *jeevan*, knowing, reflection, projection, regulation, and evidence.

Scope: This note reads the activity architecture of *jeevan* as a qualitative, hierarchical, closed-loop control system. *Satta* is Knowledge rather than an acting controller. *Jeevan* is the sentient regulator; *bal* names its established state activities, *shakti* their motion and projection, and the body their temporary medium of expression and feedback.

The exposition follows the strata the primary texts themselves set out: *jeevan* as one constitutionally complete atom, its five faculties, the ten activities that pair a state with a motion in each faculty, the 122 detailed activities into which those ten are refined, and the six activities of the sentient aspect that cut across all of them. Where the control reading requires machinery the sources do not supply—typed spaces, composed operators, gating predicates, an inquiry protocol—that machinery is gathered in Appendix A rather than woven through the exposition. The body can be read without the appendix, and the appendix can be rejected without disturbing the body.

Two axes organise the model. *Bal* and *shakti* are state and motion within each faculty; state activities are strengths and motion activities powers (JV, pp. 40, 62; MVD, pp. 131, 323; SB, p. 139). Projection and reflection are directions in which the ordered faculties are traversed—outward from *atma* toward *mun* and the body, and inward from the body and *mun* toward *atma*. Their combined form is *avartan*, the awakened *jeevan* cycle (MVD, p. 275; §1). Strength and power are also used at a coarser grain, where the five faculties themselves are the strengths and hope, thought, desire, resoluteness, and evidence the powers; the two grains are given together in one place (AVD, pp. 91, 151), and the Editorial Notes set out how they fit.

The acquired organisation of *jeevan* is treated as *sanskar*. It is distributed across *mun*, *vriddhi*, *chitta*, and *buddhi* rather than stored as information in one place, is held to the realisation at *atma* rather than deposited there, is refined through reflection, projection, result, evaluation, and correction, and remains with *jeevan* when a bodily coupling ends. The twelve practical knowledge domains specify the content organised and applied through this architecture.

The controlled objective is not the maximisation of any one value. Bliss, contentment, peace, and happiness are one immersion arising from realisation and named at four levels of *jeevan*. Where that immersion is absent, discord among the faculties produces frustration and the thirst for restfulness, and the pursuit of restfulness is what drives the loop (§3). *Saturation* is

the ontological bond through which the Knowledge to be known is available to *atma*, while coupling with the body is carried by named activities: *prana* joins the gross body to the subtle and *chitta* the subtle to the causal (§2.1). This is an interpretive functional model. It does not reduce *jeevan* to a computer, the faculties to brain regions, *sanskar* to a database, or qualitative activity to numerical variables.

1. *Jeevan* as an embodied regulator

Jeevan is a constitutionally complete atom whose nucleus is named *atma*, the particles of its first orbit *buddhi*, of its second *chitta*, of its third *vritti*, and of its fourth *mun* (MVD, p. 78; AVD, p. 87). *Atma* at that centre is the mediative activity, unaffected by generative or degenerative force. Every one of those five groupings is active, and the faculties take their names from them (AVD, p. 87). Constitutional completeness is evident in the atom's release from molecular and weight bondage together with its retention of the bondage of hope (MVD, p. 91). The five faculties are therefore orbital groupings within one unit rather than five components assembled into a system, and their ordering—*atma* innermost, *mun* outermost—is constitutional rather than a convenience of the model.

Modelled as a control system, *jeevan* realises Knowledge in coexistence and acquires its practical content as *sanskar*. *Bal* establishes that content as a qualitative internal organisation; *shakti* makes the organisation effective in projection. Through *mun*, the projected organisation selects embodied action. Bodily, relational, and natural consequences then occasion the inquiry that reflection bears inward. The loop is complete when Knowledge governs action, the result provides evidence of mutual fulfilment, and evaluation refines the organisation that will govern later projection.

Two directional movements run through the ordered faculties. **Projection**, *paravartan*, carries realised orientation outward: *atma* bears authenticity, *buddhi* forms resolve, *chitta* forms an image or plan, *vritti* analyses alternatives and consequences, *mun* selects, and *medhas* and the body express the selection in action and observable result. **Reflection**, *pratyavartan*, is the movement of awakening: each outer faculty's orientation comes to be governed by the faculty inward of it, and inquiry raised at the outer levels is borne inward. These are not separate systems but the recurrent operation of one *jeevan*, and their combined form carries a name of its own:

In awakening, hope in mun is according to vritti, thoughts in vritti are according to chitta, desires in chitta are according to enlightenment of buddhi, and enlightenment in buddhi is according to atma's realisation in existence. As a result, all the activities of reflection and projection are accomplished. The combined form of reflection and projection is referred to as the cognisance-sensitivity cycle. This itself is the awakened jeevan cycle. (MVD, p. 275)

Avartan therefore names the closed loop this note models. The two movements do not create *jeevan*'s basic capacity. *Jeevan* is constitutionally complete and its strength and power inex-

haustible; awakening changes the quality, coordination, governing criteria, and evidence of its activity without increasing its constitution quantitatively (MVD, p. 199; SB, Ch. 4). The activities themselves are inherent and are not acquired through practice. What is acquired is understood content and its coherent organisation as *sanskar*. Bodily death ends the current channel of expression and feedback, not the sentient regulator or the acquired organisation it bears.

1.1 Four distinctions the model rests on

Collapsing any of the following changes what the model claims rather than merely how it is worded.

Do not conflate	With	What turns on it
<i>Bal</i> and <i>shakti</i> , which are state and motion within a faculty	Projection and reflection, which are directions through the ordered faculties	Every faculty holds state and every faculty acts on its neighbour in both directions; treating projection as <i>shakti</i> alone makes reflection a passive return (§4)
Bodily and sensory feedback crossing the interface	<i>Pratyavartan</i> , the outer faculty's orientation coming to be governed by the inner	Feedback occasions inquiry; it is not itself borne inward, and awakening is not a consequence arriving from outside (§§6.3, 6.4)
Continuity of <i>jeevan</i> and of attained understanding	Preservation of every coordinate of a modelled state	The first is stated by the sources; the second belongs to the formalism and behaviour cannot distinguish them (§4.3; Appendix A.7)
A successful <i>bodh</i> , which cannot be false	The condition of <i>buddhi</i> , which can be alienated, expectational, or unenlightened	Without the distinction, either <i>buddhi</i> becomes a fallible belief register or its attested disorders become invisible (§§5.2, 10)

2. The system boundary and what lies outside it

A control model first requires a clear boundary. The controller is not *satta*, *atma* by itself, or the brain. *Jeevan* is the integrated sentient unit bearing all five faculties. The human being is the joint form of *jeevan* and body through which knowing becomes embodied evidence.

The solid boundary encloses *jeevan*: its five-faculty state established as *bal*, and its motion as *shakti*, which is set outward in projection and inward in *antarniyaman*. *Satta* supplies the reality-reference without acting on the controller. *Prana*, the heart, *medhas*, and the body belong to the temporary embodied interface, while body, relationship, work, society, and nature form the field in which projection produces consequences. Feedback crosses the interface, but it does not itself become internal content: it occasions the inquiry that is borne inward (§6.4).

Model element	Madhyasth Darshan referent	Function in the model	Boundary condition
Knowledge itself	<i>Satta</i> or Omnipresence	Actionless reality of <i>niyam</i> , <i>niyantran</i> , and <i>santulan</i> —the facts, rules, relations, and constraints available to be realised	Not a command source, acting controller, representation-producing mind, or perceiving subject

Model element	Madhyasth Darshan referent	Function in the model	Boundary condition
Reality and governing reference	Coexistence, including <i>jeevan</i> and humane conduct	What is to be known and the reference with which activity is to agree	Not an internal construction produced by the controller
Sentient regulator	<i>Jeevan</i>	Knower; bearer of state, motion, reflection, projection, and evaluation	Integrated unit; not reducible to an algorithm or brain process
Realised reference-centre	<i>Atma</i>	<i>Anubhav</i> in coexistence and projection as <i>pramanikta</i>	Faculty of <i>jeevan</i> , not an independent homunculus
Persistent acquired state	<i>Sanskar</i> in <i>jeevan</i>	Qualitative organisation of understanding, acceptance, criteria, valuation, and readiness for projection	Borne by <i>jeevan</i> ; not genetic inheritance, a bodily trace, or a separate memory store
Embodied interface	<i>Prana</i> , heart, <i>medhas</i> , nervous system, senses, and body	Ordered bidirectional medium between <i>jeevan</i> and bodily activity: <i>prana</i> bears upon the heart, the heart upon the cognitive and work organs, and those organs upon behaviour and gratification (MVD, p. 204)	Temporary medium of evidence, not the originating knower or bearer of <i>sanskar</i>
Controlled field	Body, relationship, work, exchange, society, and participation in nature	Where selection becomes action and produces consequences	The human joint form acts within mutuality, not on an inert external world
Feedback	Bodily condition, sensory information, material result, another person's response, and evaluation	Returns consequences for tasting, comparison, recognition, definiteness, and correction	Feedback is interpreted through the current organisation of <i>jeevan</i>

The boundary yields an essential division. The controller and its acquired qualitative state belong to *jeevan*; the body is the current interface through which that state becomes behav-

iour and receives consequences. Formation and decomposition belong to the body. Persistence, carried orientation, and the possibility of further awakening belong to *jeevan*.

2.1 Interface bonds: saturation and the named couplings

The two interfaces rest on different grounds, and conflating them obscures both.

The [ontology study](#) defines *saturation* as the inseparable presence of nature in Omnipresence: every unit is soaked, submerged, and surrounded in *satta*. Saturation is a condition of existence rather than a temporal event, an external efficient cause, or an exchange of energy (§1.2). Because *jeevan*, including *atma*, exists saturated in *satta*, coexistence is ontologically present and available for *anubhav*. *Satta* does not send signals, issue commands, or become a second subject; knowing and *anubhav* belong to *jeevan* and *atma*.

The *jeevan*–body interface does not require saturation to do that second work, because the activities that carry it are named. Body, heart, and *prana* together are the gross body; *mun*, *vritti*, and *chitta* the subtle body; *buddhi* and *atma* the causal body, where “body” means activity rather than anatomy. The union of gross and subtle is through *prana*, and the union of subtle and causal is through *chitta*, the causal and subtle activities being indivisible (MVD, pp. 204–205). Desires follow from the causal and subtle bodies, while work and behaviour follow from the subtle and gross.

Interface	What carries it	What remains unspecified
<i>Satta–atma</i>	Saturation, as the standing ontological condition under which coexistence is available to <i>anubhav</i>	Whether the relation requires anything beyond saturation
Subtle–causal, that is <i>chitta–buddhi</i>	<i>Chitta</i> , as the coupling activity between the two	How the coupling admits some content and withholds other content
Gross–subtle, that is body– <i>mun</i>	<i>Prana</i> , as the coupling activity between the two	How a particular selection becomes a particular bodily process

A mechanism is indicated for the outermost stage. Vibrational motion conveyed to *medhas* from the cognitive organs is the wave through which knowledge unfolds, and the wave arising from *jeevan*’s own signal is that through which sensitivity and cognisance become apparent in behaviour; the impetus behind sensory activity is a wave in the *prana* air bearing the effect of *mun* (MVD, p. 200). This is more determinate than an appeal to saturation, and it is where a physical account would have to engage the darshan. What it does not supply is a discriminating theory—why one wave carries this content rather than that—which §11.1 records as an open limit.

2.2 Knowledge as actionless regulatory structure

The model must distinguish **regulation as Knowledge** from **regulation as performed activity**. In *satta*, *niyam*, *niyantran*, and *santulan* are not acts being continuously executed by a cosmic controller. They name the definite facts and relations of coexistence: how an activity is constituted, what preserves its relatedness and purpose, and what balance obtains when participating units remain mutually compatible. In control-system language, these are the ground truth, constraints, and reference relations of the model. “Representation” here means their realised or conceptual form within *jeevan*; it does not imply that *satta* contains mental symbols.

The active meaning appears in the unit, and especially in awakened human doing. *Jeevan* knows the relevant fact or rule, accepts it as the basis of activity, selects accordingly, and evaluates whether the result exhibits balance. Actionless Knowledge thereby becomes the governing content of action without *satta* itself becoming an actor:

Knowledge as fact and rule → realisation and definitive understanding → regulation of selection and action → balance evident in the result

3. What the system regulates toward

A control system is defined by what it is regulating toward. The objective here is *vishram*, restfulness: the eradication of unhappiness, attained as resolution and named the ultimate goal of the universe, of which awakened human tradition is the evidence (MVD, p. 68). Restfulness is not idleness. Effort, motion, and result continue in every constitutionally evolving unit, and there is no lack of effort in *jeevan* until it has developed the capacity, ability, and receptivity for restfulness (MVD, pp. 78–79). The objective is therefore recurrent coherence under continuing activity, not the cessation of activity.

3.1 The reference: one immersion named at four levels

Bliss, contentment, peace, and happiness are not four separate quantities to be traded against one another. They are one immersion, *aplavan*, described as effect and flow, which arises from realisation in Omnipresence and reaches through the four faculties outward from *atma*:

Buddhi, chitta, vritti, and mun are affected from immersion (as effect and flow) attained by realisation in Omnipresence. This immersion is referred to as bliss at the level of buddhi, contentment at the level of chitta, peace at the level of vritti, and happiness at the level of mun. This realisation itself is the highest achievement in jeevan. (MVD, p. 307)

Immersion is the effect of delusionlessness, and *buddhi* becomes immersed on attaining it (MVD, p. 77). Bliss specifically is the effect upon *buddhi* of *atma* realised in truth (MVD, p. 101), and the effect of realisation reaches as immersion into *buddhi*, *chitta*, *vritti*, and *mun*

alike (MVD, pp. 155–156). In control terms this is the reference of the system: a single flow whose presence at a level is that level’s satisfaction. It is not a reward computed from results, and it does not originate at the outer end where results arrive.

The same four values are also given as what obtains when adjoining activities are in concurrence, and the ladder extends in both directions beyond *jeevan*:

Concurrent pair	What the concurrence yields
Just behaviour and vocation	Coexistence and prosperity
Body and heart	Satisfaction
Heart and <i>prana</i>	Health and growth
<i>Prana</i> and <i>mun</i>	Strength and motivation
<i>Mun</i> and <i>vritti</i>	Happiness
<i>Vritti</i> and <i>chitta</i>	Peace
<i>Chitta</i> and <i>buddhi</i>	Contentment
<i>Buddhi</i> and <i>atma</i>	Bliss
<i>Atma</i> and Omnipresence	Eternal concurrence, realised as ultimate bliss and its evidence

The two accounts agree term for term: the value named at a faculty is the value of that faculty’s concurrence with the faculty inward of it. Bliss is felt at *buddhi* and arises from *buddhi*’s concurrence with *atma*; happiness is felt at *mun* and arises from *mun*’s concurrence with *vritti*. The ladder’s outer rungs show that the embodied levels—body, heart, *prana*—carry their own concurrence values, and that just behaviour and vocation extend the same relation into the controlled field as coexistence and prosperity (MVD, p. 327; JV, p. 138).

3.2 The error signal and what drives the loop

The system has a definite error signal, and it is structural rather than incidental. Each faculty is more developed than the one outside it: *mun* than the body, *vritti* than *mun*, *chitta* than *vritti*, *buddhi* than *chitta*. When the outer end sets the terms—when hope in *mun* seeks the satisfaction of bodily sensation and thought, desire, and expectation are recruited to support it—the more developed faculty cannot conform to the less developed one, and their mutualities fall into discord:

The steering of the gross body is according to mun, whereby there is hope between them. However, since vritti is more developed than mun, it is unable to become according to the hope of mun, resulting in mutual discord. Vritti intends to use mun and body according to itself. Similarly, there is mutual discord between vritti and chitta. This discord itself proves to be the cause of frustration and thirst for restfulness. (MVD, p. 276)

Vishamata, discord, is the error; *shram ki anubhuti*, frustration of effort, is its manifestation; and *vishram ki trisha*, the thirst for restfulness, is the drive it produces. Frustration is the shortcoming in converting capacity and ability into effort, which is incompleteness of receptivity (MVD, p. 79), and frustration of effort is the cause of development itself, issuing in the thirst for restfulness (MVD, p. 91). Every deluded human remains anxious for restfulness (MVD, p. 68). The pursuit does not have to be motivated from outside the architecture: the gradient guarantees that where the immersion is absent, *jeevan* is unsatisfied and seeks it.

The satisfied condition is described in the same terms, and it inverts the governing direction rather than intensifying the pursuit:

In awakening, mun remains immersed by vritti, vritti by chitta, chitta by buddhi, and buddhi by atma. As a result of being active in this manner, due to being satisfied, their functions attain their full potential, leading to no frustration of effort, and restfulness becoming evident in all levels of jeevan. This itself is the comprehensive resolution or abhyudaya. In this state, the body becomes completely regulated by mun, meaning the senses become regulated based on cognisance. (MVD, p. 277)

Full effective capacity is therefore a consequence of satisfaction, not a precondition for it, and the regulation of sensitivity by cognisance is a result of the inversion rather than an act of suppression (§8).

3.3 Governing facts and humane criteria

At the level of Knowledge the reference structure is *niyam–niyantran–santulan*. *Niyam* is the definite fact, law, or rule according to which an activity and relationship are constituted. *Niyantran* is the constraint or regulated relatedness by which the activity remains aligned with its constitution and purpose. *Santulan* is the fact or condition of balance among activities and units in mutuality. At the level of doing, an awakened human understands these reference facts, regulates activity accordingly, and evaluates their manifestation as balance. The reference is actionless; recognition, selection, execution, and evaluation are activities of *jeevan* and the human joint form.

For humane conduct, justice, *dharma*, and truth supply the governing criteria. Activity is successful when it protects the relationship on which it depends, fulfils its accepted purpose, and produces mutual satisfaction rather than unilateral advantage. Since *atma* is the media-

tive activity at the centre of the unit, it is natural for *buddhi*, *chitta*, *vritti*, *mun*, and the body to be regulated by it, and the effort that resists this regulation is what gives rise to discord (MVD, p. 277). Reference and error are consequently two descriptions of one arrangement: correct regulation is the immersion reaching every level, and error is its obstruction at some level.

4. State and motion: *bal* and *shakti*

Every unit is activity with state and motion. The strength and power of an entity manifest in its state and motion respectively (JV, p. 40), and the plane of a unit is determined by its form, its essential nature, and the strength and power inherent in it, this itself being its state and motion (MVD, p. 131). For *jeevan* the identity is stated directly: the 122 activities are found in the form of strength and power, that is, in state and motion (MVD, p. 323), and in the awakened human *bal* and *shakti* become evident as state and motion, which are inseparable (SB, p. 139). State activities are strengths and motion activities powers, the motion activities being evidenced in their mutuality with one another and the state activities realised within oneself (JV, p. 62).

- ***Bal* is activity in state:** an inwardly established capacity, condition, valuation, meaning, definiteness, or realisation.
- ***Shakti* is activity in motion:** the corresponding selection, analysis, formation, resolve, projection, or evidencing of that state.

This yields a compact functional relation:

established state (*bal*) → operative transition (*shakti*) → manifest orientation → embodied evidence

State and motion are a distinct axis from projection and reflection. *Bal* is what a faculty has established in itself, whichever direction the loop is currently running; *shakti* is that establishment becoming effective toward an adjoining activity, and the direction in which it becomes effective is a separate matter (§6). Collapsing the two axes would make projection a property of *shakti* alone and reflection a property of *bal* alone, which the architecture does not support: every faculty holds state and every faculty acts on its neighbour in both movements.

“State” does not mean inactivity. Tasting, deliberation, contemplation, enlightenment, and realisation are active modes of establishment. “Motion” is wider than bodily movement. Selection, analysis, image-formation, resolve, and authenticity are motions because they make an established organisation effective toward another activity, an action, or a result. *Bal* is accordingly not an operator acting upon a separate passive store called “state”; its activities are the modes in which content is established as the state of *jeevan*.

Shakti holds no second state, but it does have a direction, and the direction is regulated rather than fixed. Set outward, it carries the established organisation into authenticity, resolve, image or plan, analysis, and selection. Set inward through *antarniyaman*, it produces

in a faculty the capacity to receive the signal of the faculty inward of it—the ability to receive higher-conformance signals arises solely through the internal regulation of *jeevan*’s powers (MVD, p. 284). Where a unit’s powers flow outward alone, decline is apparent; where they are turned inward, development is apparent, inward deployment being drawing conclusions through reflection, inspection, and examination in self, and then evidencing them (MVD, p. 91). This gives reflection a mechanism of its own rather than leaving it as projection reversed.

4.1 Inherent provision and effective state

Two meanings of capacity must remain distinct.

Capacity sense	Status in the model	What development means
Constitutional capacity	<i>Jeevan</i> ’s complete and inexhaustible provision of <i>bal</i> and <i>shakti</i>	Does not increase or decrease quantitatively
Effective capacity	The currently active clarity, receptivity, coordination, criteria, and evidential reach of those activities	Can be refined qualitatively through study, realisation, practice, and evaluation

Awakening therefore does not install more power. The provision is complete with constitutional completeness itself: on release from weight and molecular bondage the atom is endowed with inexhaustible strength and power (AVD, p. 84). What awakening changes is which activities become effective, what contents and criteria organise them, how well adjoining faculties communicate, and whether projection agrees with realisation.

Effective capacity is not left as a matter of degree. In the knowledge order, *buddhi* is described in three statuses, each identified by which faculty is actually driving the others:

Status	Tendency of desire, thought, and hope	Which faculty governs
Partially awakened	Desire-based	<i>Mun</i> and <i>vriddhi</i> are driven by <i>chitta</i>
Half awakened	Based on resolve without <i>atma-bodh</i>	<i>Mun</i> , <i>vriddhi</i> , and <i>chitta</i> are driven by <i>buddhi</i>
Awakened	Based on resolve with <i>atma-bodh</i>	<i>Mun</i> , <i>vriddhi</i> , <i>chitta</i> , and <i>buddhi</i> are regulated and disciplined by <i>atma</i>

These are gradations of governing reference rather than of available power (MVD, pp. 278–279). Constitutional capacity is unaffected throughout: orbital motion within the atom arises from attraction and retraction and continues in every status, differing in form between delusion and awakening rather than in quantity (MVD, p. 200).

Effective capacity has a name of its own, and it is given as three terms rather than one magnitude. Capacity, ability, and receptivity—*kshamata*, *yogyata*, and *patrata*—are the intellectual means (MVD, p. 62). They arise from the interconnected process of environment, study, and prior *sanskar*, and movement toward awakening or decline depends solely on them (MVD, p. 134); they follow from the *sanskar* of the sentient unit (MVD, p. 298); each unit stands in its plane according to them (MVD, p. 132); and attaining them in the form suited to realisation is the pinnacle of a unit's awakening (MVD, p. 302). None of that concerns quantity of provision. No consulted passage says that *bal* or *shakti* increases; what the trio varies is what the constitutionally complete provision is currently able to do.

The three terms are also distributed rather than global, and the distribution follows the projection cascade of §6.2. The complete development of *chitta* is by attaining the **capacity** for creative visualisation according to the signals of *buddhi* in the presence of truth's realisation; of *vritti*, from the **ability** to generate thoughts of *dharma* on accepting the signals of *chitta*; and of *mun*, by acquiring the **receptivity** for just behaviour on accepting the signals of *vritti* (MVD, pp. 322–323). *Kshamata* accordingly names what *chitta* must have to form an image adequate to *buddhi*'s signal, *yogyata* what *vritti* must have to generate thought adequate to *chitta*'s, and *patrata* what *mun* must have to take *vritti*'s signal into conduct. For *buddhi* and *atma* the same passage names only the accepting of *atma*'s signals and realisation in coexistence, so the trio as stated covers the three outer faculties (§11.2).

Their acquisition is a conversion, and both its failure and its success are named. *Kshobh*, frustration, is the shortcoming in converting capacity and ability into effort, and this is the incompleteness of receptivity; *agreshan*, ascending, is the balance or receptivity gained in that same conversion (MVD, pp. 78–79). The three condition one another rather than forming one scale: at the root of endeavour is capacity, at the root of capacity study, at the root of study receptivity, at the root of receptivity ability, and at the root of ability the practice of literature, behaviour, and work (MVD, p. 144). They also admit of degree where the receptivity conditions of §6.3 do not: the extent of one's receptivity constitutes one's qualification (MVD, p. 142), and between two people one side may have a greater or lesser degree of ability and receptivity than the other, with married life useful for striving toward balance in them (MVD, p. 248).

4.2 *Sanskar* as acquired distributed organisation

Sanskar is the learning state of this control model. It is acceptance toward completeness; knowledge, wisdom, and science carried toward resolution and evidence; understanding and tendencies for materialising what is understood; and physical, verbal, and mental activity directed toward completeness (MVD, p. 90). Humans are correspondingly *sanskar*-conforming units, with *sanskar* taking the combined form of understanding, honesty, responsibility, and participation (JV, p. 50).

Its place is fixed by contrast with the other orders. The material order is engaged in sequential events of results, the biological order in sequential events of seasons, the animal order in sequential events of instincts, and all human lives in sequential events of *sanskar* (MVD, p.

211). What varies from one order to the next is what carries continuity across events. For the human being it is neither the result nor the season nor the instinct but the acquired organisation itself, which is why a control model of human activity cannot treat that organisation as an accessory to the loop.

It is therefore insufficient to equate *sanskar* with information remembered by *chitta*. Retained representation is one part of it, but *sanskar* is the organisation of understood content across the state-structure, taking the form of attained awakening in *mun*, *vriddhi*, *chitta*, and *buddhi* (MVD, p. 121):

Dimension	Form taken by acquired Knowledge
<i>Buddhi</i>	Made definite through <i>bodh</i> and directive through <i>sankalp</i>
<i>Chitta</i>	Retained as meaning and <i>smriti</i> , contemplated, and represented as a possible way of living
<i>Vriddhi</i>	Organised as criteria, deliberation, judgment, and resolved thought
<i>Mun</i>	Established as valuation, expectation, tasting, and selection

Atma stands in a different relation to this organisation. Realisation in coexistence is what the four are awakened toward and what authenticity carries outward from; it is the reference with which acquired content comes to agree rather than a fifth deposit of acquired content (Editorial Notes). The established *bal* configuration of the four outer faculties is the state-side form of operative *sanskar*, held to the realised reference at the centre, while the corresponding *shakti* activities are its transition, projection, communication, and evidence. “Acquired” refers to content and organisation, not to the constitutional activities themselves.

Because this organisation belongs to *jeevan* rather than the body, it persists. Bodily formation follows composition and heredity, whereas *sanskar* belongs to the sentient aspect and becomes evident through the awakening of *mun*, *vriddhi*, *chitta*, and *buddhi* (MVD, p. 121); the cause of the body’s successive conditions is inertial impression or heredity, and the cause of the sentient aspect’s awakening is *sanskar* (MVD, p. 90). The human being is a joint expression of both aspects on exactly this division: the body is primarily species-conformant while consciousness is shaped by *sanskar*-conformance (SB, p. 63). Acceptances toward completeness, the understanding available for evidence, and the unresolved gap among knowing, wanting, doing, and undergoing are carried forward in relation to *prarabdha* (MVD, pp. 90–91). *Sanskar* therefore does not have to be transferred out of a dying body: it remains with the *jeevan* whose state it organises.

The organisation is evaluable rather than neutral. Awakening in the sentient aspect is itself *sanskar*, and this is *susanskar*, while delusion under animal consciousness is *kusanskar*; in the joint form of *jeevan* and body the same organisation is reckoned as culture and civilisation, and becomes evident in tradition (MVD, pp. 314–315). Environment, study, and practice are what accomplish it, its effect being called *prabhava* and the effect’s issue *fal* (MVD, p.

121). The learning state of this model consequently has a direction built into it, so an organisation can be more or less coherent without the model requiring an external scale on which to score it.

4.3 Continuity across bodily death and re-embodiment

The ordinary reflection–projection loop operates through a living body, but the boundary of *jeevan* is not the lifespan of that body. *Jeevan* continues after bodily death and associates with a later body (JV, pp. 20, 55). Where understanding and satisfaction have been attained, their established state continues because *jeevan* does not die (JV, p. 77). In control terms, bodily death disconnects the current interface; it does not create a new controller or reset the qualitative state of the existing one.

Continuity of *sanskar* does not require explicit autobiographical memory of an earlier embodiment. Its organisation can persist as governing criteria, valuation, expectation, readiness, or behavioural tendency without the person recalling when or how it was acquired. Explicit *smriti* is one possible content of *chitta*; it is not the form in which every carried *sanskar* must appear.

The later embodiment does not begin with an empty controller. Its behaviour may manifest *sanskar* established before the present body, while present bodily capacity, family and social environment, education, new choices, and fresh feedback continue to modify what becomes effective:

present behaviour = projection(carried *sanskar*, present understanding and selection, current body and circumstances)

This is not mechanical determinism. A present act does not by itself reveal when each component of its governing organisation was acquired. Behaviour is evidence of the operative state of *jeevan* within the darshan's account, but it is not a public test that separates previous-embodiment *sanskar* from present learning, bodily condition, or social influence.

5. The five faculties and their paired activities

The five faculties are not five independent controllers. A sentient unit has five indivisible strengths—*mun*, *vritti*, *chitta*, *buddhi*, and *atma* (MVD, p. 275)—so they form an ordered, recurrent stack within one *jeevan* rather than a federation of parts.

The ordering is a developmental gradient, not merely a sequence: *mun* is more developed than the body, *vritti* than *mun*, *chitta* than *vritti*, and *buddhi* than *chitta* (MVD, p. 276). This is what makes the architecture a control problem at all. A more developed faculty cannot be made to conform to a less developed one, so if governance runs outward-in, the stack is necessarily in discord and the four values are unavailable (§3.2). Harmony is an achievement of the inward-governed arrangement rather than a default of the architecture, and each faculty is inspiration for the one outside it—*mun* for the body, *vritti* for *mun*, *chitta* for *vritti*, *buddhi* for *chitta*, *atma* for *buddhi*, and realisation in coexistence for *atma* (MVD, p. 276).

Each faculty has exactly two functions, and the pairs are given identically in two places. *Mun* has selection (*chayan*) and taste (*asvadan*); *vritti* analysis (*vishleshan*) and deliberation (*tulan*); *chitta* visualisation (*chitran*) and contemplation (*chintan*); *buddhi* resolve (*sankalp*) and enlightenment (*bodh*); *atma* authenticity (*pramanikta*) and realisation (*anubhav*). Every *jeevan* operates continuously through these ten activities (JV, p. 73). The detailed enumeration of the 122 activities is organised by the same pairs, each faculty's block being headed with them: the two activities of *atma* as realisation and authenticity, the four of *buddhi* in the form of enlightenment and resolve, the sixteen of *chitta* in the form of contemplation and visualisation, the thirty-six of *vritti* in the form of deliberation and analysis, and the sixty-four of *mun* in the form of selection and taste (MVD, pp. 328, 329, 332, 339).

The pair members divide by state and motion, and the same division appears as direction: the power of *mun* is selection in projection and taste in reflection, of *vritti* analysis in projection and deliberation in reflection, of *chitta* visualisation in projection and contemplation in reflection, of *buddhi* resolve in projection and enlightenment in reflection, and of *atma* authenticity in projection and realisation in reflection (SB, p. 63).

The state-and-motion division is also stated of these ten directly: five of the ten activities function in the form of *bal* and five in the form of *shakti*, and in the awakened human *bal* and *shakti* become evident as state and motion (SB, p. 139). Each faculty's *shakti* there is the outward member of its pair—*chayan*, *vishleshan*, *chitran*, *sankalp*, *pramanikta*—while its *bal* is what comes to be recognised in the pair taken whole. The inward member is the *bal* activity directly: *asvadan*, *tulan*, *chintan*, *bodh*, and *anubhav* are the five *bal* always present in *jeevan* for manifestation (AVD, p. 151), and the tabulated enumeration places them in the *bal* column (AVD, pp. 91–94; §9.1).

Faculty	Regulated dimension	<i>Bal</i> : established state activity	<i>Shakti</i> : transition or projection	Manifest orientation
<i>Atma</i>	Realisation	<i>Anubhav</i> : realisation in coexistence	<i>Pramanikta</i> : authenticity and evidencing	<i>Praman</i> , living evidence
<i>Buddhi</i>	Definiteness and commitment	<i>Bodh</i> : enlightenment as definitive understanding	<i>Sankalp</i> : resolve according to understanding	<i>Ritam bhara</i> , truth-bearing resolve
<i>Chitta</i>	Meaning and representation	<i>Chintan</i> : contemplation, with <i>sakshatkar</i> as direct recognition	<i>Chitran</i> : visualisation as image, possibility, or plan	<i>Ichha</i> , desire
<i>Vritti</i>	Deliberation and analysis	<i>Tulan</i> : deliberation under definite criteria	<i>Vishleshan</i> : analysis of alternatives and consequences	<i>Vichar</i> , thought
<i>Mun</i>	Valuation and selection	<i>Asvadan</i> : taste, the assessment of acceptability	<i>Chayan</i> : selection according to valuation	<i>Asha</i> , hope

The orientations in the last column are located at the faculties. The sources also locate the same five at the couplings between faculties, and the choice made here is recorded in the Editorial Notes rather than argued in place.

5.1 *Atma*: realisation and authenticity

Anubhav is realisation in coexistence, not an episodic sensation or emotional state. It is not a fallible estimate that can be partly true and partly false. Where a content has not reached realisation, *anubhav* concerning it is not yet effectively established; where it is established, it is reality-concurrent. Its projective activity, *pramanikta*, is authenticity: realised understanding becoming effective as evidence. *Atma* provides the reference with which definitive understanding and projected conduct must agree. It does not issue detailed commands to lower faculties. Its regulatory role is realised centrality and authenticity, and the complete development of *atma* lies in realisation in coexistence (MVD, p. 323).

5.2 *Buddhi*: enlightenment and resolve

Bodh says “yes, this is so” only when a meaning recognised in *chitta* is correctly understood. This is stronger than *manyata*, assent or belief accepted on authority. Subjective certainty, firmness, or commitment does not turn an incorrect interpretation into *bodh*; such content remains assumption, judgment, or unresolved meaning. For any particular content, *buddhi*

either establishes reality-concurrent definiteness or *bodh* concerning that content is not yet effective. Its reach may be incomplete across the contents required for living, but an established *bodh* is not itself incorrect. *Sankalp* converts definiteness into governing commitment. That an established *bodh* cannot be false says nothing about the condition of *buddhi* where *bodh* is not effective. Non-alignment with *atma* perturbs *buddhi*, and the lack of the enlightenment of truth is that perturbation: delusion, ignorance, conceit, and ingratitude are its named forms, and holding its own knowledge superior is ego (MVD, pp. 216–217, 279). In delusion *buddhi* is reduced to expectation in support of desire (MVD, p. 276). The gate can therefore be alienated, expectational, or unenlightened; what it cannot do is issue a definiteness that reality does not bear out (§10).

The sequence is:

direct recognition in *chitta* → *bodh* in *buddhi* → *sankalp* → organisation of image, analysis, valuation, and selection

Bodh is the proximate ground of qualitative development in *chitta*, *vritti*, and *mun*, because their operations can now be governed by correct understanding. *Anubhav* remains the ultimate ground. *Buddhi* validates and commits; it does not create the constitutional strength or power of the other faculties.

5.3 *Chitta*: contemplation and visualisation

Chintan sustains and contemplates meaning. *Sakshatkar* is successful direct recognition: language or information becomes recognisable as the reality it indicates. *Chitran* gives that meaning a projectable form—an image, anticipated relationship, possibility, plan, or communicable representation. *Chitta* thereby carries a meaning-bearing model of the intended result, whose quality depends on agreement with recognised meaning rather than on imaginative richness alone. Its complete development lies in the capacity for creative visualisation according to the signals of *buddhi* in the presence of truth’s realisation (MVD, p. 323).

5.4 *Vritti*: deliberation and analysis

Tulan deliberates through criteria; *vishleshan* distinguishes alternatives, implications, and consequences. *Vritti* does not merely calculate efficiency; it determines which criteria govern the deliberation. Deciding justice and injustice, *dharma* and *adharma*, truth and untruth is the innateness of *vritti* itself (MVD, p. 204), so that jurisdiction is constitutional rather than assigned by the model, and the complete development of *vritti* is the ability to generate thoughts of *dharma* on accepting the signals of *chitta* (MVD, p. 323).

Each of the six evaluative perspectives becomes clear only with respect to its own referent, and it is the referents that make the set an ordering rather than a ranking of preferences:

Perspective	Referent with respect to which it becomes clear
Pleasant–unpleasant	Instincts

Perspective	Referent with respect to which it becomes clear
Healthy–unhealthy	The body
Profit–loss	Goods and services
Justice–injustice	Behaviour
<i>Dharma–adharma</i>	Resolution
Truth–untruth	Realisation in existence

The first three are read against conditions that vary; the last three against behaviour, resolution, and existence (MVD, p. 66). A deliberation goes wrong not by using the pleasant–unpleasant perspective but by applying it to a question whose referent is behaviour or resolution, which §10 records as criterion inversion. This division also fixes the extent of *vritti*’s operation in delusion, where deliberation runs under the first three perspectives only (§8). Awakening does not discard pleasure, health, or material result; it places them under criteria whose referents can preserve relationship, resolution, and coexistence.

5.5 *Mun*: selection and taste

Asvadan receives and tastes the acceptability of a possibility or result. *Chayan* selects according to that valuation, choosing what is pleasing to *mun* in expectation of taste (MVD, p. 327). Happiness and unhappiness from what is received and tasted through the organs of sound, touch, sight, taste, and smell is the innateness of *mun* (MVD, p. 204), which is why valuation is proprietary to it rather than delegated from *vritti*.

Mun is the final sentient gate toward bodily execution and the first *sentient* faculty to receive interpreted bodily and sensory feedback—not the first recipient outright. Below it the gross body has its own ordered stages: the four instincts of eating, sleeping, defending, and mating are the innateness of the heart, *prana*’s domain is the heart, the heart’s domain is the cognitive and work organs, and their domain is behaviour and gratification (MVD, p. 204). The outermost interface is therefore *prana*–heart–organs rather than *medhas* alone (§2.1). Selection reflects the whole current organisation of *jeevan*: what is understood, imagined, deliberated, expected, and valued, and the complete development of *mun* is receptivity for just behaviour on accepting the signals of *vritti* (MVD, p. 323).

6. The closed reflection–projection loop

The diagram separates two coupled recurrences. The intrinsic loop, *avartan*, belongs to *jeevan*: projection and reflection continue among the five faculties, and recurrence without bodily execution is attested at its shallowest, where the union of *vritti* and *mun* alone yields dreams, “imaginations that do not become evident in work and behaviour” (MVD, p. 279; §8). The embodied branch begins when a selection is made available to *medhas* and the body; its consequences can then occasion further inquiry within the intrinsic reflective movement. *Jeevan* remains the persistent controller, while *medhas* and the body are the present interface. The twelve practical knowledge domains constitute governing content within *sanskar* rather than additional signal blocks, and the diagram in §4.3 places the embodied branch within the longer continuity across bodily couplings.

The two directions are not mirror images, and a control abstraction has to preserve the asymmetry. *Sanket*, signal, is the vocabulary of the inner-to-outer direction: each faculty develops completely by accepting the signals of the faculty inward of it. What moves outer-to-inner is named differently—inquiry, as *jigyasa*, *kautuhal*, or *prashna*—and its arrival at an inner faculty is described as effect and immersion rather than as signal reception. Treating reflection

as projection run backwards, with the same content interpreted at each stage in reverse, would impart a symmetry the sources do not have.

6.1 The six activities of the sentient aspect

Sensing, enquiring, protecting, enlightening, adhering, and reflecting are specialties of the sentient aspect that are not found in the insentient (MVD, p. 313). They belong to sentience as such rather than to any particular faculty, which is a different axis of classification from the faculty-indexed enumeration of §9.

Activity	Definition (MVD, pp. 313–314)
<i>Samvedan</i> , sensing	Knowledge of the five cognitive organs and the five work organs; also the tendency for development
<i>Samvahan</i> , enquiring	The act of bearing inquiries for knowledge of completeness
<i>Sanrakshan</i> , protecting	Paving the way towards development
<i>Sambodhan</i> , enlightening	Imparting knowledge and understanding of reality
<i>Samvartan</i> , adhering	The act of following the received signals towards refinement and completeness
<i>Pratyavartan</i> , reflecting	Movement of awakening

These six give the loop its content without recourse to a sensor-and-actuator scheme. What travels inward is an inquiry raised toward completeness, not a measurement; what travels outward is the understanding of reality, not a command. Adherence is the outer faculty’s own activity upon what it has received, which is why receiving a signal and being changed by it are distinct events in this architecture. *Sanrakshan* has no directional content: it names the clearing of the way, and its absence is a failure mode the model should predict (§10). Appendix A.4 renders three of the six as a request-and-response protocol between adjoining faculties in order to formalise the inward movement; that reading belongs to the appendix and not to the sources.

6.2 Projection: state becomes control action

Projection carries the established organisation of *sanskara* through the intrinsic dependency:
realisation/authenticity → definiteness/resolve → meaning/image → deliberation/analysis → valuation/selection

This sequence completes the projective movement within *jeevan*. It can produce an image, plan, deliberation, expectation, or selected possibility that becomes material for further re-

flection without bodily execution. When the selection crosses the embodied interface, an additional chain follows:

selection → medhas → body → speech, action, or work → result

The dependency is not a conversion of one substance into another. *Pramanikta* does not literally become *sankalp*, and resolve does not literally become an image. Each faculty receives the governing orientation of the adjoining faculty and performs its own paired activity.

What passes outward is *sambodhan*, the imparting of the understanding of reality, and its reception is the condition of each faculty's own completion rather than the delivery of an instruction. The complete development of *atma* lies in realisation in coexistence; of *buddhi*, in accepting the signals of *atma*; of *chitta*, in creative visualisation according to the signals of *buddhi* in the presence of truth's realisation; of *vriddhi*, in accepting the signals of *chitta*, which is the ability to generate thoughts of *dharma*; and of *mun*, in acquiring receptivity for just behaviour on accepting the signals of *vriddhi* (MVD, p. 323). Projection is consequently developmental at every stage: a faculty that receives well is thereby completed, which is why the same chain appears in §8 as the description of awakening.

What passes outward is also named stage by stage, and the names are given at the couplings rather than at the faculties. Realisation of coexistence occurs in *atma* and its *bodh* in *buddhi*; in the union of *buddhi* and *chitta* the *pratiti* or awareness of realisation occurs, and this is itself the contemplation of realisation; in the union of *chitta* and *vriddhi* its *aabhas* or comprehension occurs, which is the deliberation activity in the form of justice, *dharma*, and truth; and in the union of *vriddhi* and *mun* its *bhas* or perception occurs, which becomes evident as the tasting of values and the selection of relationships (MVD, pp. 99–100). The reference is therefore neither delivered to *mun* as realisation nor degraded into something unrelated on the way out. At each coupling it takes the form the receiving pair is able to establish, and *pratiti*, *aabhas*, and *bhas* name those forms—which is why *chintan* is defined as the awareness of truth and resolved thought as its comprehension (MVD, p. 316).

The body is not a passive actuator. Health, fatigue, skill, sensory condition, available material, other people, and the natural environment constrain what can be performed. Embodied evidence therefore belongs to the human joint form, not to disembodied *jeevan* or brain alone.

6.3 *Pratyavartan*: conformance and receptivity

Pratyavartan is the motion of awakening (MVD, p. 314), and it is reflection in the strict sense of the sources: not the return of a consequence, but the outer faculty's orientation coming to be governed by the faculty inward of it. Hope in *mun* becomes according to the thoughts arising in *vriddhi*; desire in *chitta* is given action-form through those thoughts; the resolve of *buddhi* is aimed at *atma*'s realisation—and it is this regulation that constitutes the activity (MVD, p. 277). Its order runs inward the whole way: the reflection of *mun* occurs in *vriddhi*, of *vriddhi* in *chitta*, of *chitta* in *buddhi*, of *buddhi* in *atma*, and of *atma* in Omnipresence; *atma* realises in coexistence, and only then does the reflection of *buddhi* be-

come possible (MVD, p. 307). Reflection itself is the cause of awakening (MVD, p. 307). What travels that path has content: justice, *dharma*, and truth become active in *vritti* and course inward through *chitta* and *buddhi* to realisation in *atma* (AVD, p. 86).

The mechanism is receptivity, and it is regulated:

The ability of receiving higher-conformance signals arises solely through the internal regulation process of jeevan's powers. This is the reflection of behaviour into thought, thought into desire, desire into resolve, and resolve into realisation or mediative activity. (MVD, p. 284)

This is where the inward movement gets a mechanism distinct from projection. *Antarniyaman* turns motion inward, and what it produces is not content but the capacity to receive—so a faculty can be signalled without being changed, and becoming capable of reception is a separate accomplishment from the signal's availability. Each level's reception is conditional in a specific way:

Reception	Condition of its occurrence	What is required
Reflection of hope, in <i>mun</i>	Absence of crime	The pressure and influence of orderliness
Reflection of thought, in <i>vritti</i>	Absence of injustice	The influence of societal conduct
Reflection of desire, in <i>chitta</i>	Absence of attachment	The influence of study and <i>sanskar</i>
Reflection of resolve, in <i>buddhi</i>	Absence of ignorance	<i>Antarniyaman</i> , or <i>dhyan</i>

Reflection succeeds or fails according to these conditions (MVD, p. 284). Three of the four are social and educative rather than introspective, which is a substantive claim about the loop: the inward movement of a single *jeevan* depends on arrangements outside it, and the model cannot represent awakening as a purely internal optimisation. *Dhyan* is focusing *mun*, *vritti*, *chitta*, and *buddhi* both to understand and, after understanding, to evidence—so it belongs to both directions of the loop rather than to reflection alone.

How the conditions are stated bears on what happens outside a level at which the inward movement fails. The formulation is threshold-like throughout—*mun* becomes capable of receiving *vritti*'s signal, *vritti* of receiving *chitta*'s, and so on (MVD, pp. 282–283)—and reflection at a level is said to succeed or to fail, not to succeed partially. The four values are withheld on the same terms: until *buddhi*, *chitta*, *vritti*, and *mun* become completely affected by *atma*, there is no realisation of bliss in *buddhi*, contentment in *chitta*, peace in *vritti*, or happiness in *mun* (MVD, p. 290), and awakening at each level continues until the capacity be-

longing to that level is attained (MVD, p. 156). Outward activity does not stop where alignment fails. It operates perturbed, with the disorders §10 lists (MVD, pp. 216–217), and visualisation formed without the enlightenment of truth necessarily carries flaws of excess, deficiency, or omission, which is the imaginary imposition the sources call conceit or delusion (MVD, p. 286). The model therefore reads the inward movement as conditional gating with perturbed outward operation rather than as one flow arriving in weakened form. The receptivity conditions themselves are stated privatively and without degree, while receptivity and ability are elsewhere matters of extent and of greater or lesser degree (MVD, pp. 142, 248; §4.1)—a difference the sources do not reconcile (§11.2).

6.4 Inquiry borne inward

What travels inward is inquiry. *Samvahan* is the bearing of inquiries for knowledge of completeness (MVD, p. 314), and the inward-facing movement is named at every level:

Faculty	Inward-facing activity	What it is
<i>Mun</i>	<i>Kautuhal</i> , curiosity	The impetus to know the unknown and attain the unattained
<i>Vritti</i>	<i>Utsah</i> , enthusiasm	Intrepidity toward rise or development
<i>Chitta</i>	<i>Ahlad</i> , delight	The lack of the sentiment of lacking, on awareness of that absence
<i>Buddhi</i>	<i>Ullas</i> and <i>aplavan</i> , elation and immersion	The effect of delusionlessness
<i>Atma</i>	<i>Anubhuti</i> , realisation	Understanding, state and motion, emergence, and result obtained through natural progression

This series is the mode of channelling *jeevan*’s energies toward development, and inward regulation of those energies is essential to it (MVD, pp. 77–78). The inward movement is therefore motivational before it is informational: curiosity in *mun* is not a report about a result but an impetus toward what is not yet known. *Vritti*’s own *samvedna* is described partly in the same register, as movement for completeness and as the pain toward development and awakening—quest, expectation, and hope. The same entry also gives it the grasping of external signals through all the cognitive organs, so the register is not exclusively motivational (MVD, p. 337; Editorial Notes).

Reflection within *jeevan* proceeds through the reverse faculty order, **mun** → **vritti** → **chitta** → **buddhi** → **atma**. When an embodied consequence occasions the movement, that internal order is preceded by an external path, **result** → **bodily and sensory signal** → **mun**. The result does not travel inward as a message. It raises an inquiry, and what returns is the understanding of reality, which the outer faculty then follows. The stages below describe what each faculty establishes when this happens, not what is relayed through it. The

first row details the embodied branch; the rows from *mun* through *atma* also apply when the movement begins from internally projected or retained content.

Stage	Occasion at this level	Establishing activity, <i>bal</i>	What becomes established	Projective counterpart, <i>shakti</i>
<i>Medhas</i> , senses, and body	Hunger and satiety, pain and ease, fatigue and energy, health and impairment; sound, touch, visible form, taste, and smell; speech and action observed; material and bodily result; another person's response	Bodily and neural mediation of the joint form	Signals concerning bodily condition, event, result, and response; words and symbols available for meaning-recognition	Bodily execution, speech, work, behaviour, and the production of a new result
<i>Mun</i>	Bodily and sensory signals, attraction and aversion, satisfaction and dissatisfaction, anticipated or observed result	<i>Asvadan</i> : tasting or valuing acceptability	Hope and expectation; the felt acceptability or unacceptability of the result	<i>Chayan</i> : selection of a response, object, means, word, or act
<i>Vritti</i>	The valued result, possible alternatives, prior expectation, and the relevant relationship or need	<i>Tulan</i> : deliberation under pleasant–unpleasant, healthy–unhealthy, profit–loss, justice–injustice, <i>dharma</i> – <i>adharma</i> , and truth–untruth	Comparative judgment or thought: what agrees, conflicts, fulfils, harms, or remains unresolved	<i>Vishleshan</i> : analysis of alternatives, means, implications, and consequences
<i>Chitta</i>	Comparative thought, communicated language, retained representation, and the form of the observed situation	<i>Chintan</i> and <i>sakshatkar</i> : contemplation and direct recognition	Recognised identity, form, property, relationship, process, result, and purpose	<i>Chitran</i> : an image, possibility, explanation, or plan expressing that meaning

Stage	Occasion at this level	Establishing activity, <i>bal</i>	What becomes established	Projective counterpart, <i>shakti</i>
<i>Buddhi</i>	Meaning recognised in <i>chitta</i> and its proposed agreement with reality and purpose	<i>Bodh</i> : enlightenment as definitive understanding	Definite acceptance of what is so, what the governing criterion is, and what course is coherent with it	<i>Sankalp</i> : commitment or resolve to organise projection accordingly
<i>Atma</i>	Definitive understanding made available through <i>buddhi</i>	<i>Anubhav</i> : realisation in coexistence	Realised concurrence with Knowledge; the reference-state rather than another stored record	<i>Pramanikta</i> : authenticity through which realisation becomes evident

The inward movement can consequently be read as **embodied event and result** → **tasted hope or valuation** → **comparative thought** → **recognised meaning and desire** → **definiteness and resolve** → **realisation**, which corresponds to reflection as behaviour into thought, thought into desire, desire into resolve, and resolve into realisation (MVD, pp. 282–284). Each faculty performs its own establishing activity on what has become available to it; none relays identical data to the next. If a candidate meaning does not agree with reality, it remains unestablished rather than becoming incorrect *bodh*, and bodily feedback does not write a fallible conclusion into *atma*. A bodily signal does not arrive already labelled as justice, fulfilment, or truth; its meaning depends on the effective depth and criteria of reflection. Carried *sanskar* and memory are not additional external channels; they are part of the current internal state through which incoming signals are interpreted.

6.5 Practice, assimilation, and transmission

Practice is the learning operation of the embodied loop. It does not manufacture the activities of *jeevan* or begin from a necessarily blank state; it engages the carried and presently acquired organisation so that understood content becomes coherent *sanskar*. A complete practice cycle includes receiving an explanation, recognising its meaning, examining it through deliberation, becoming definite through *bodh*, relating it to *anubhav*, projecting it into conduct, evaluating the result, and correcting the internal organisation.

The causal direction here is unusually explicit, and it runs from outer conduct to inner state:

1. Following or emulating the just behaviour. 2. Being and abiding in resolved thoughts (dharma-based thoughts). The firmness and dedication in the above two programs leads to the authority for realisation of verity, as a result buddhi becomes immersed. (MVD, p. 282)

Two outward practices held with firmness and dedication yield the authority for realisation, and the consequence stated is that *buddhi* becomes immersed. They work in both registers at once, which is what makes them more than moral counsel: the immersion is stated as a positive attainment, and the same two practices are what secure the privative conditions of §6.3, since reflection of hope, thought, desire, and resolve requires the absence of crime, injustice, attachment, and ignorance, and those absences are secured through the enforcement of orderliness, the influence of societal conduct, study and *sanskar*, and *antarniyaman* (MVD, p. 284). The receptivity conditions of §6.3 are met in the same way: *mun* becomes capable of receiving *vrutti*'s signal and turns to just behaviour; *vrutti* becomes capable of receiving *chitta*'s and peace is realised; *chitta* becomes capable of receiving *buddhi*'s and contentment is realised; *buddhi* becomes capable of receiving *atma*'s and *atma-bodh* occurs (MVD, pp. 282–283). The loop closes when *buddhi*'s reflection toward *atma* takes place, at which point *atma-bodh* and realisation in Omnipresence become effective together and keep *buddhi* immersed (MVD, p. 286). Practice is thus not merely how the outer levels are trained; it is how the inner levels become receivable at all, which is why the model treats conduct as load-bearing rather than as the mere output of understanding.

Assimilation is complete only when the content becomes effective in all five dimensions. Information remembered in *chitta* but not validated in *buddhi* remains uncertain; a principle accepted in *buddhi* but not organised through *vrutti* and *mun* remains unevidenced; and an action repeated through the body without correct reference may strengthen habit without establishing Knowledge.

Explanation to another person is a projective activity of *sanskar* and a test of its coherence. Comprehension becomes evident in the ability to convey the understanding to others (JV, p. 26). Explanation does not copy *sanskar* into the recipient. It supplies language, indication, and a proposed organisation; the recipient must recognise, examine, understand, practise, and evidence it through their own faculties. Transmission is correspondingly an inquiry-answering relation: the *guru* is one who establishes inquiries and questions, in the form of resolution, into conception, while the *shishya* is one presented to receive and accept (MVD, p. 344). Teaching therefore engages the same bearing of inquiry that carries it inward within a single *jeevan* (§6.4), which is how personal understanding becomes *upakar* and continues as humane tradition.

7. The twelve practical knowledges as distributed governing content

The twelvefold practical schema distinguishes the **content that is known** from the **activities that know and apply it**. The overall knowledge *jeevan* organises and applies is seen as these twelve aspects. They are not twelve more faculties, twelve additional *bal-shakti* operations, or twelve records held in one location; they are domain labels for content that becomes *sanskar* only by being distributed across realisation, definiteness, representation, deliberation, valuation, selection, and evidence. The twelvefold comes from Shri A. Nagraj's oral expositions rather than from a passage in the printed sources consulted here, whose attestation of the individual groups the Editorial Notes record.

The content may be indexed as:

$$\mathbf{D}_{12} = (\mathbf{V}_{1...4}, \mathbf{S}_{1...4}, \mathbf{E}_{1...3}, \mathbf{U})$$

Here **V** denotes knowledge of four bodily propensities, **S** knowledge of four sensory activities, **E** knowledge of the three *eshanas*, and **U** knowledge of *upakar*. *D* is only a compact index of definite known content; it does not mean numerical data or a database located in one faculty.

Knowledge family	Count	What must be known	Role as distributed governing content
Bodily propensities	4	Eating, sleeping, protection or defence, and mating: their bodily purpose, need, means, proper performance, limits, and effect on health and relationship	Specifies how the body is nourished, protected, rested, and continued without making bodily satisfaction the purpose of <i>jeevan</i>
Sensory activities	4	What each sensory activity is, how it is rightly performed, which bodily and sensory channels it uses, what information or result it provides, and what constitutes misuse	Specifies how sensitivity supplies usable body-world information and how cognisance regulates its employment
<i>Eshanas</i>	3	<i>Vitteshana</i> , <i>putreshana</i> , and <i>lokeshana</i> : their structure, legitimate purpose, required relationships and means, and rightful employment	Specifies how wealth, familial and social continuity, and public recognition become responsibilities under resolution rather than possessive drives

Knowledge family	Count	What must be known	Role as distributed governing content
<i>Upakar</i>	1	The need for help, the other's material or epistemic requirement, one's own capacity and means, the right form of help, and the result expected in prosperity or awakening	Specifies higher-human participation through which resolved capacity supports another without dependency or exploitation
Total	12	Practical knowledge for embodied and relational activity	Supplies the content on which the activities of <i>jeevan</i> operate

Sensory activity and sensory modality are distinct. Sound, touch, visible form, taste, and smell are bodily channels through which information becomes available; what has to be known is how such activity is rightly performed and what constitutes its misuse. What this note cannot yet supply is the source-Hindi name and definition of each of the four sensory activities, which the printed sources consulted do not enumerate as a set (Editorial Notes; §11.2).

For every member of **D₁₂**, adequate knowledge has a common structure: the **identity** of the activity or motive; the **purpose** it serves; the **procedure** by which it can be competently performed; the **means and interface** of body, senses, skills, relationships, and material resources it requires; the **rule** and governing criterion that preserve its rightful use; the **balance** among need, use, relationship, and available means; and the **evidence** that would show fulfilment or reveal error.

This is why the twelve kinds may be described both as the content being worked on and as what drives activity. “Data” here means known content instantiated throughout *jeevan*, not input delivered to a central processor. *Atma* realises its ground in Knowledge; *buddhi* validates its meaning and forms commitment; *chitta* retains and represents the intended result; *vritti* deliberates among alternatives under its rules; *mun* selects; and the body performs. The result returns as feedback against the same known structure.

7.1 Where the content becomes most directly effective

The content is distributed, but the primary texts support different dominant points of effect.

Knowledge family	Most direct effect	Distribution across the complete loop
Four bodily propensities	<i>Mun</i> and body: immediate tasting, expectation, selection, and performance	In awakening, <i>vritti</i> supplies governing deliberation, <i>chitta</i> the meaningful intended form, <i>buddhi</i> definitive purpose, and <i>atma</i> the realised reference
Four sensory activities	Body– <i>medhas</i> , <i>mun</i> , and <i>vritti</i> : signal reception, valuation, selection, and sensory regulation	<i>Chitta</i> interprets and represents meaning; <i>buddhi</i> validates right use; the higher reference prevents sensitivity from defining happiness
Three <i>eshanas</i>	<i>Vritti</i> as awakened thought, followed by representation in <i>chitta</i> and selection in <i>mun</i>	<i>Vitteshana</i> becomes just acquisition and right use, <i>putreshana</i> family and social continuity, and <i>lokeshana</i> participation in undivided society and humane tradition
<i>Upakar</i>	The whole projection cascade: resolve in <i>buddhi</i> , benevolent visualisation in <i>chitta</i> , <i>daya–krupa–karuna</i> in <i>vritti</i> , and <i>mamata–udarata</i> in <i>mun</i>	Realisation-based authenticity grounds help; body, mind, and wealth make it effective for another's prosperity and awakening

These are functional associations rather than exclusive storage locations. The four propensities arise from the hope of *mun*, while the three *eshanas* are nourished by awakened thought (MVD, p. 305). The sensory and work-organ activities appear within the detailed activities of *mun*, while *samvedna* in *vritti* includes grasping external signals through the cognitive organs and performing work, behaviour, and thought according to the law-triad (MVD, p. 337). *Upakar* is distributed across the detailed activities of *chitta*, *vritti*, and *mun*, and its complete expression depends on resolve and authenticity.

Sensory and bodily information is necessary. Error occurs when it becomes the final governing reference. Eating, for example, can be pleasant, health-supporting, affordable, just in exchange, ecologically responsible, and suitable to family need. The task is not suppression but ordering: cognisance regulates sensitivity so that bodily, relational, material, and coexistential requirements remain compatible (SB, p. 64; MVD, pp. 65–68). No single feedback channel is sufficient for this. Bodily feedback reports health, fatigue, pain, ease, nourishment, and skill; material feedback whether work produced the intended object, service, or sufficiency; relational feedback whether values were recognised and fulfilled and whether both persons can evaluate mutual satisfaction; and internal feedback whether adjoining faculties are harmonious or remain contradictory. Pleasant sensation can coexist with bodily harm, profit with injustice, and private conviction with failed relationship.

8. Operating regimes: delusion and awakening

The same constitutional architecture can operate in two qualitatively different regimes, and what distinguishes them is which end of the stack supplies the reference. In delusion the outer end sets the terms: hope in *mun* rests on sensation, thought in *vriddhi* follows that hope, desire in *chitta* follows that thought, and *buddhi* is reduced to expectation in support of the desire—the sense-rooted sensitivity system, with *buddhi*’s alienation from *atma* producing deluded visualisation and desire (MVD, pp. 275–276). In awakening the direction inverts: *mun* is immersed by *vriddhi*, *vriddhi* by *chitta*, *chitta* by *buddhi*, and *buddhi* by *atma* (MVD, p. 277).

The two regimes are therefore one architecture under opposite governance, and the inversion is what a control abstraction exists to express. It also explains why they differ in satisfaction rather than in capability. Outward-set governance asks a more developed faculty to conform to a less developed one, which the gradient forbids, so discord and frustration persist however skilful the loop becomes (§§3.2, 5). Inward-set governance asks each faculty to conform to the one whose development exceeds it, which it can do, and full effective capacity follows from the resulting satisfaction.

The effective depth of the deluded loop is stated exactly, and the arithmetic is worth following because it locates the shortfall precisely. Deluded humans of the knowledge order have selection and taste in *mun*; analysis and deliberation towards pleasure, health, and profit in *vriddhi*; and visualisation in *chitta*—and these constitute the four and a half activities by way of delusion (MVD, p. 89). The half is deliberation: the four and a half are selection, taste, analysis, visualisation, and half of deliberation, deliberation based on sensitivity operating from the perspective of pleasure, health, and profit (JV, p. 73). *Tulan* counts as half because it runs under only the first three of the six evaluative perspectives, leaving justice, *dharma*, and truth unused (§5.4). *Chitta* contributes one activity, visualisation, with contemplation absent altogether; *buddhi* and *atma* contribute none. This matches the constitutional description, in which *jeevan* expresses its four and a half activities with activeness in the fourth, third, and second orbits—*mun*, *vriddhi*, and *chitta*—through the body-based way (MVD, p. 79).

What the half restricts is jurisdiction, and the consequence of the restriction is stated. Deliberation confined to the perspectives of pleasant, health, and profit does not become the content of contemplation, because all of these are senses-based and return to tasting, so selection made on those terms is accomplished entirely within the confines of the four and a half activities, that is, up to the visualisation activity (AVD, p. 152). The half is therefore not a weakened *tulan* feeding a weakened *chintan*; it is a *tulan* whose result cannot enter *chitta*’s contemplative activity at all, which is why contemplation is absent rather than partial. Alongside jurisdiction the sources also speak of effectiveness for the set of ten, four and a half being effective while the remaining activities lack the substance for understanding (JV, p. 73), but no comparable fraction is assigned to analysis or to visualisation. What is said of visualisation is different in kind: without the enlightenment of truth it necessarily carries the flaws of excess, deficiency, or omission (MVD, p. 286; §11.2).

Model feature	Delusion	Awakening
Assumed identity	Body taken as self	<i>Jeevan</i> known as knower and body as medium
Effective loop depth	Four and a half activities: selection and taste in <i>mun</i> , analysis and half of deliberation in <i>vritti</i> , visualisation in <i>chitta</i>	All ten activities become effectively coordinated through enlightenment and realisation
Governing reference	Fragments of the twelve knowledge domains are interpreted through sensory satisfaction, bodily benefit, material gain, assumption, and established behaviour	<i>Satta</i> is realised as Knowledge; <i>niyam–niyantran–santulan</i> and the twelve practical knowledge contents govern doing
<i>Sanskar</i> and carried orientation	Carried and presently acquired organisation remains only partially coordinated; received assumptions and sensory habits can govern projection	Understanding, honesty, responsibility, and participation form a coherent distributed organisation
Deliberative criteria	Pleasant–unpleasant, healthy–unhealthy, profit–loss treated as final	Justice–injustice, <i>dharma–adharma</i> , truth–untruth govern the relative criteria
Projection	Can be skilful and powerful but internally contradictory	Resolve, representation, analysis, and selection agree with understanding
Feedback interpretation	Immediate or unilateral result dominates	Bodily condition, relationship, mutual satisfaction, and orderliness are considered together
Characteristic result	Intermittent satisfaction with recurring contradiction	Resolution, harmony, mutual fulfilment, and evidence

Delusion is not the absence of a control loop. It is a partially effective loop organised by an inadequate reference and shallow evaluative closure. A person may display powerful imagination, analysis, planning, and bodily skill while those powers remain sensory-governed. Awakening is not the addition of a new controller. It is the qualitative reconfiguration of reference, criteria, receptivity, and coordination in the existing architecture. Until *atma-bodh*, ego is the basis of all physical, verbal, and mental activity in waking, dream, and sleep alike, appearing as conceit in *chitta*, stubbornness in *vritti*, and attachment and agitation in *mun*, and the union of *vritti* and *mun* alone yields sleep or dream (MVD, p. 279).

Neither regime begins anew with each body. Re-embodiment supplies a new bodily interface to the continuing *jeevan*; it does not erase the orientation already established. The distinc-

tion between the regimes concerns what governs and coordinates the carried state, not whether a persistent controller is present.

9. The 122 activities

The ten-activity architecture is refined into 122 detailed activities. The per-faculty counts and their identity with state and motion are given at MVD, p. 323, the activities are named and defined at pp. 328–348, and the whole set is tabulated as the 122 conducts of awakened *jeevan* at AVD, pp. 91–94. The enumeration specifies how *jeevan* is internally established and becomes active in state and motion; it does not add another content set beside *sanskar* or the twelve practical knowledge domains.

The total is not a bare count. It is given as an arithmetic decomposition of the constitution of *jeevan* itself:

$$2 \times (1 + 2 + 8 + 18 + 32) = 2 \times 61 = 122$$

The inner sum counts constitutional positions. One column of the table is headed *constituent of jeevan* and runs nucleus, first orbit, second, third, fourth—the same five loci that name the faculties (AVD, p. 91; MVD, p. 78; §1). The factor of two is the pairing: each locus carries one state activity and one motion activity, which is why the nucleus has two activities and each orbit two (JV, pp. 92–93), and why every entry in the detailed definitions is a dyad rather than a single term (MVD, pp. 328–348).

Locus	Faculty	Positions	Activities	Block heading in the source
Nucleus	<i>Atma</i>	1	2	Realisation and authenticity (MVD, p. 328)
First orbit	<i>Buddhi</i>	2	4	Enlightenment and resolve (MVD, p. 328)
Second orbit	<i>Chitta</i>	8	16	Contemplation and visualisation (MVD, p. 329)
Third orbit	<i>Vritti</i>	18	36	Deliberation and analysis (MVD, p. 332)
Fourth orbit	<i>Mun</i>	32	64	Selection and taste (MVD, p. 339)
Total		61	122	Strength and power, that is, state and motion (MVD, p. 323)

What the sources supply here is a decomposition, not a derivation. The positions are stated; no consulted passage argues them from anything more basic, and the general account of atomic constitution says only that each orbit holds one or more particles (MVD, p. 78; §§11.1, 11.2).

9.1 The 61 pairs and their state–motion partition

The 61 pairs divide evenly, and the division is the source’s own rather than a grid imposed on the list. The tabulated enumeration has five columns: the activities of inexhaustible *bal* under the heading *pratyavartan*, the name of the *bal*, the constituent of *jeevan*, the name of the *shakti*, and the activities of inexhaustible *shakti* under the heading *paravartan* (AVD, pp. 91–94). Every one of the 122 stands in one activity column or the other, giving 61 state activities and 61 motion activities. The same assignment is legible in the detailed definitions, where each dyad heading names its *bal* first and its *shakti* second—*shruti* before *smriti*, *vidya* before *pragya*, *bhakti* before *tanmayata* (MVD, pp. 328–348).

Faculty	<i>Bal</i> : state activities	<i>Shakti</i> : motion activities	Total	Generic pair
<i>Atma</i>	1	1	2	Realisation–authenticity
<i>Buddhi</i>	2	2	4	Enlightenment–resolve
<i>Chitta</i>	8	8	16	Contemplation–visualisation
<i>Vritti</i>	18	18	36	Deliberation–analysis
<i>Mun</i>	32	32	64	Taste–selection
Total	61	61	122	State–motion

Two consequences follow for the reading adopted here. At the level of the individual activity the state–motion axis and the projection–reflection axis coincide, the *bal* activities being the reflective ones and the *shakti* activities the projective ones, which is the alignment Appendix A.3 and A.4 assume. And the two grains at which strength and power are used turn out to be one scheme at two levels, the faculty being the *bal* and the manifest orientation its *shakti* (Editorial Notes).

9.2 What the enumeration specifies

The detailed activities are not 122 brain modules, scalar variables, energy levels, or independently switchable functions. The ten activities of §5 state what *jeevan* does; the 61 pairs state what it does it over. Each pair occupies one constitutional position and fixes one content type: what the state activity there establishes, and how the paired motion activity makes it effective.

Read that way, each faculty’s block is an inventory of its own jurisdiction. *Atma*’s single pair carries eternal presence and realisation-based expression, which is the reference and its evidencing (MVD, p. 328). *Buddhi*’s two pairs carry bliss with *dhee* and existence with *dhruti*—uninterrupted celebration with readiness for projection, and delusion-free acceptance of state, motion, development, awakening, and the present, whose mark is the absence of fear

and trust in the present (MVD, pp. 328–329). Definiteness and fearlessness exhaust what *buddhi* holds.

Chitta’s eight pairs are the representational and evaluative repertoire: articulation with memory, intellect with art, radiance with form, inspection with properties, contentment with abundance, love with non-otherness, guidance with effortlessness, and reverence with devoutness (MVD, pp. 329–332). Visualisation itself has eight dimensions—form, property, count, time, expanse, effort, motion, result—which fix what a projected image must contain (MVD, p. 327). *Vritti*’s eighteen pairs are the criteria of deliberation together with the dispositions that sustain them, running from learning and intelligence through truth and *dharma*, justice and sensitivity, restraint and law, to satiation and confirmation (MVD, pp. 332–339); that inventory is the same jurisdiction *vritti* holds constitutionally in deciding justice, *dharma*, and truth (MVD, p. 204; §5.4).

Mun’s thirty-two pairs fall into two groups. Twenty-two are relational values—devotion, care, respect, affection, the parental, filial, teaching, and spousal relationships, self-reliance, prosperity, wellness, modesty, and the rest—and ten are sensory: soft and hard, cold and hot, the six tastes, smell, and visible form (MVD, pp. 339–348). Between them they exhaust what can be received and valued, which is *mun*’s innateness (MVD, p. 204; §5.5).

A pair can accordingly be characterised by which faculty owns it, what the state activity establishes, how the paired motion activity makes that state effective, which reality or relationship is involved, which criterion governs it, through which adjoining faculty or embodied path it becomes effective, and what observable fulfilment would close the loop.

10. Failure modes

The control formulation exposes several distinct ways activity can fail.

Failure mode	Description	Likely manifestation
Wrong reference	The lower-faculty loop treats body, sensation, possession, status, or belief as the final ground because definitive understanding and realisation are not effectively governing it	Repeated pursuit without continuous satisfaction
Missing or misclassified knowledge content	One of the twelve domains is ignored, confused with another, or known only as a name without purpose, procedure, rule, or evidential result	Action operates on incomplete content even when reasoning appears consistent
Information without <i>sanskar</i>	Content is remembered or repeated but is not made definite, deliberated, selected, practised, and evidenced across all five dimensions	Verbal knowledge remains disconnected from conduct

Failure mode	Description	Likely manifestation
Repetition without correct reference	An activity is practised repeatedly while sensory satisfaction, social approval, or assumption remains its governing criterion	Habit and skill become stronger without qualitative awakening
Shallow reflection	Feedback reaches valuation and analysis but not definitive understanding or realisation	Technically effective action with unresolved contradiction
Criterion inversion	Pleasure, health, or profit governs justice, <i>dharma</i> , and truth	Efficient exploitation or rationalised injustice
Semantic error	<i>Chitta</i> forms an image that does not accord with the recognised meaning of relationship or purpose	Attractive plans that cannot fulfil the relationship
Validation without commitment	A principle is verbally accepted, but <i>sankalp</i> does not follow <i>bodh</i>	Persistent gap between stated understanding and conduct
Projection without competence	Resolve is correct, but planning, skill, bodily condition, or material means are inadequate	Good intention with ineffective or harmful execution
Incomplete feedback	Only one's own intention or advantage is evaluated	Claimed fulfilment without mutual satisfaction
Inquiry not raised	No question is borne inward, so no signal is sought and none can return	Stable, self-consistent operation at shallow depth with no felt need for examination
Signal available but unreceived	The inner faculty's signal is available while the outer faculty's receptivity condition fails	Correct understanding present in the situation without effect on conduct
Perturbation of a faculty	A faculty not aligned with the one inward of it takes its own operation to be supreme: perturbed <i>buddhi</i> holds its knowledge superior, which is ego; perturbed <i>chitta</i> its planning; perturbed <i>vriddhi</i> its reasoning; perturbed <i>mun</i> gratification	Dispute rather than resolution, each party defending the level at which it is arrested

Failure mode	Description	Likely manifestation
Interface opacity	Vibration and wave are named as the medium at the <i>jeevan–medhas</i> boundary, but no discriminating account explains why a given wave carries this content rather than that	Explanatory gap between sentient selection and neural activity
Embodiment-reset assumption	A new body is treated as a new controller with an empty state	The persistence of <i>sanskar</i> and its later behavioural manifestation become unintelligible
Origin over-attribution	Present behaviour is assigned wholly to previous-embodiment <i>sanskar</i>	Current bodily condition, education, relationship, choice, and feedback are ignored

The perturbation row has direct textual warrant, and the sources extend it outward past *mun*. Non-alignment of *buddhi* with *atma* perturbs *buddhi*, of *chitta* with *buddhi* perturbs *chitta*, of *vrutti* with *chitta* perturbs *vrutti*, of *mun* with *vrutti* perturbs *mun*—and when *prana*, heart, body, and action are not according to *mun*, the perturbation appears in behaviour within relationships and associations. The failures are named at each level: anxiety and lack of enthusiasm in *prana*; loneliness and unhappiness in *mun*; laziness, negligence, and unrest in *vrutti*; artificiality, mystery, and dissatisfaction in *chitta*; delusion, ignorance, conceit, and ingratitude where *buddhi* is without enlightenment. Opportunism is the root, and the lack of the enlightenment of truth is the perturbation of *buddhi* itself (MVD, pp. 216–217).

These are diagnostic distinctions, not clinical categories. Their value is to prevent every contradiction from being attributed vaguely to “lack of knowledge.” The model identifies where reference, state, transition, receptivity, interface, execution, or evaluation may be incomplete.

11. Limits and open questions

11.1 Interpretive limits

The control-system vocabulary is useful only within explicit limits.

- **Jeevan is not a machine.** The model describes functional organisation; it does not replace sentience, realisation, or meaning with computation.
- **Atma is not a homunculus or executive processor.** Its regulatory role is realised reference and authenticity, not the issuance of microscopic commands.
- **Atma is not a fallible estimator.** An incorrect or partly false conclusion is not *anubhav*; incompleteness concerns whether realisation effectively governs and becomes evident through the whole loop.

- **Buddhi is not a belief register.** Incorrect interpretation and subjective certainty remain within unresolved lower-faculty organisation; *bodh* names reality-concurrent definiteness, while incompleteness concerns its effective reach, coordination, and projection.
- **Satta is Knowledge, not an input signal.** Modelling *niyam*, *niyantran*, and *santulan* as facts, rules, and reference relations does not turn *satta* into a database, command agent, energy source, or external intervention.
- **Bal is not stored physical force, and shakti is not transferable spiritual energy.** They are activity in state and activity in motion.
- **The bal–shakti axis is used at two grains.** The activity-level reading is used here. The faculty-level reading, in which the five faculties are the strengths and hope, thought, desire, resoluteness, and evidence the powers, is given alongside it in one place and is treated as the same scheme at a coarser grain; the residue that treatment leaves is recorded in the Editorial Notes.
- **The twelvefold is not anchored in the printed sources.** It is given in oral exposition, and the individual groups are attested in print, but no consulted passage enumerates the twelve as a set or names the four sensory activities (Editorial Notes; §11.2).
- **The faculties are not anatomical brain regions.** They are the nucleus and the first four orbital groups of one constitutionally complete atom (§1). *Medhas* and the body mediate expression and feedback.
- **The 122 activities are not numerical state variables.** The source gives a qualitative taxonomy but no measurement scales, transfer functions, or externally validated identification procedure.
- **The constitutional positions are stated, not derived.** The decomposition $2 \times (1 + 2 + 8 + 18 + 32)$ fixes the total from the constitution of *jeevan* rather than leaving 122 unexplained (§9), but nothing argues why an orbit holds the number of positions it holds, and the general account of atomic constitution says only that each orbit holds one or more particles (MVD, p. 78).
- **The twelve knowledges are content, not twelve additional activities.** They specify what must be known for rightful doing; the ten and 122 activities describe how *jeevan* establishes and applies that content.
- **Sanskara is not a separate memory store.** It is the acquired organisation of understanding, acceptance, responsibility, participation, and readiness distributed across the activities of *jeevan*.
- **Explanation does not transfer sanskara mechanically.** It presents meaning and organisation for another *jeevan* to recognise, examine, assimilate, practise, and evidence.
- **Happiness is not a reward scalar.** It is the name of one immersion at one level, inseparable from peace, contentment, bliss, just relationship, and mutual fulfilment

(§3.1).

- **The couplings are named, but their operation is not explained.** *Prana* and *chitta* are identified as the activities joining the three bodies, and vibration and wave as the medium at *medhas*; what remains open is how a particular selection becomes a particular bodily process and how a particular bodily signal occasions a determinate sentient content (§2.1).
- **Receptivity is a condition, not yet a theory of its own.** Reflection at a level requires the absence of crime, injustice, attachment, or ignorance, *antarniyaman* raises receptivity, and *patrata* is named as *mun*'s member of the trio of §4.1. What remains unstated is what constitutes the sufficient absence, and how a partial absence bears on partial reception, given that the conditions carry no degree while receptivity itself is a matter of extent (§6.3).
- **Re-embodiment is not yet a coupling theory.** The same *jeevan* continues and later associates with another body, and the sources place that association in the womb from about the fourth or fifth month of pregnancy (JV, p. 94). What the model cannot specify is why a particular *jeevan* becomes coupled with a particular developing body.
- **Behaviour is not a unique provenance test.** Behaviour can manifest carried *sanskar*, but observation of an act alone cannot separate earlier-embodiment organisation from present education, bodily condition, social circumstances, and current selection.
- **Appendix A is the model's own construction.** Its typed spaces, composed operators, gating predicates, inquiry protocol, Boolean value predicates, and carriage relation make the reading definite; the sources neither state nor exclude them, and rejecting the appendix leaves the body intact.

The model is therefore a qualitative architecture and a research programme. It clarifies components, directions, dependencies, criteria, persistence, and possible failure points. It does not provide a quantitative dynamical system, an empirically discriminating theory of the *jeevan-body* interface, or a public procedure for identifying the earlier-embodiment contribution to present behaviour.

11.2 Questions for further research

Where a search settled part of a question, the settled part now stands in the body or the Editorial Notes and only the residue is stated here.

1. What are the source-Hindi names and definitions of the four sensory activities of the twelvefold, and how do they stand to the five modalities? The modalities are named throughout, *samvedna* in *vritti* includes the grasping of external signals through all the cognitive organs, and *mun*'s sensory pairs cover four modality groups, but no passage consulted in MVD, SB, JV, AVD, JVD, or KD enumerates four sensory activities as a set (MVD, pp. 337, 347–348).

2. Where in the recorded expositions is the twelvefold given? The one session held in [References/Madhyasth-Darshan/Nagraj-Recorded-Sessions/](#) does not contain it and the wider transcription corpus is not yet promoted into [References/](#), so the search has to move there. The nearest printed passage sets the four instincts and the three *eshanas* against each other as levels of evaluation—deluded humans valuing the instincts most, discerning humans the *eshanas*, delusion-free humans liberation from delusion—rather than as members of one list (MVD, p. 319).
3. Can the seven-part specification of §7 be derived from the schemas the sources do give—form, properties, essential nature, and *dharma* for any unit (MVD, p. 273), and the four domains of complete knowledge, namely the holistic view of existence as coexistence, *jeevan*, humane conduct, and participation in the overall orderliness (KD, §3.5, p. 69)—or does it remain the model’s own template?
4. What observable change shows that one of the twelve contents has become distributed *sanskara* rather than remaining information or verbal acceptance? The test the sources themselves give is evidence in conduct and the ability to convey the understanding to another (JV, p. 26; MVD, p. 344), which still has to be distinguished from fluent restatement.
5. Can each of the 61 pairs be expressed as a definite state–transition specification with content, governing criterion, adjoining interface, and evidential result, and how does practice refine them? The enumeration supplies a uniform two-slot form but not uniform fields: some dyads state a criterion or an evidential result and others a single clause, and the tabulated version has five columns with none of the three (MVD, pp. 328–348; AVD, pp. 91–94).
6. Capacity, ability, and receptivity are assigned to *chitta*, *vritti*, and *mun* at complete development (§4.1). What plays the corresponding role at *buddhi* and *atma*, for which the same passage names only the accepting of *atma*’s signals and realisation in coexistence (MVD, pp. 322–323)?
7. *Sakshatkar* is placed in *chitta* as the affirmation study reaches there (MVD, p. 126), the *sakshatkar* of enlightenment and resolve is called realisation-based contemplation (MVD, p. 99), and the recorded session treats *sakshatkar* as the one thing worked at, with *bodh*, *anubhav*, and *praman* following of themselves. Does *sakshatkar* name *chintan* at that locus, or the moment at which study succeeds (Editorial Notes)?
8. What observations could distinguish a loop governed by justice, *dharma*, and truth from one that merely reports those criteria while remaining governed by sensory or social reward?
9. How can mutual satisfaction be evaluated without reducing it to agreement, compliance, or self-report? Justice is defined as recognising relationships, fulfilling values, evaluating, and reaching mutual satisfaction (MVD, pp. 311, 336), which names the terminus without supplying a way of assessing it from outside the relationship.

10. *Prana* and *chitta* are named as the couplings among the three bodies, and vibration conveyed to *medhas* as the medium of the outermost stage. What account would make that signalling discriminating without reducing sentient activity to neural activity or leaving the interface causally indeterminate?
11. What activity, if any, refines or otherwise changes the organisation of *jeevan* while it is not coupled with a body? The sources assert continuity and later association without describing development in the interval; the nearest case of reduced coupling is the union of *uritti* and *mun* alone, which yields sleep or dream and is not evidenced in work and behaviour (MVD, p. 279).
12. What determines the association of a particular continuing *jeevan* with a particular developing body, and what role does saturation play beyond supplying the ontological condition of coupling? The division of determinants is stated—the body follows species-conformance and heredity while consciousness follows *sanskar*-conformance (MVD, pp. 90, 121; SB, p. 63)—and the coupling is timed from about the fourth or fifth month of pregnancy (JV, p. 94), but no consulted passage gives a pairing rule, and *prarabdhi* is described as what remains to be undergone rather than as a matching principle (MVD, pp. 90–91).
13. What observations could distinguish the behavioural effect of carried *sanskar* from present bodily disposition, education, environment, and deliberate choice without reasoning circularly from the behaviour to its proposed origin? The sources cut against a hereditary reading of it—the *medhas* system is held equal in all humans, and the children of the learned turn out to be fools and the children of fools learned (KD, §3.16, p. 143)—which sharpens the question rather than answering it.
14. Can the model be related rigorously to contemporary control theory, predictive processing, or cognitive architecture while preserving the darshan's ontological distinctions?
15. What determines whether inquiry is raised at all? Every human is said to have a thirst for understanding, and that thirst is itself the evidence that receptivity is present in all humans (MVD, p. 88); *kautuhal* is placed in *mun* (MVD, p. 78); *samvahan* bears inquiries for knowledge of completeness (MVD, p. 314); frustration of effort issues in the thirst for restfulness (MVD, p. 91); and study is imparted according to the disciple's need and inquiry (MVD, p. 248). What no consulted passage supplies is why the standing thirst becomes an actual question in one case and not in another, which a loop stable at shallow depth needs (§10).
16. The inward movement reads as conditional gating with perturbed outward operation rather than as attenuated flow (§6.3). What observation in conduct would distinguish the two readings?
17. Do the four receptivity conditions—absence of crime, injustice, attachment, and ignorance—admit of degrees? They are stated privatively and their outcome as success or failure, while receptivity and ability are elsewhere matters of extent and of greater or

- lesser degree (MVD, pp. 142, 248). Can partial reception be defined without reasoning backwards from the conduct it was invoked to explain?
18. Three of the four receptivity conditions are met through orderliness, societal conduct, and study rather than through individual practice (§6.3). What does that imply for a control model of a single *jeevan*, whose loop is then not closed within the unit being modelled?
 19. Each faculty is named as a *bal* and each manifest orientation as its *shakti*, while the same faculty's reflective activity is also called a *bal* (AVD, pp. 91, 151). Does that nesting hold throughout, and how does it stand to SB, p. 139, where a faculty's *bal* is recognised in the pair taken whole, and to SB, p. 80, where *manobal* manifests as hope-*shakti* and is identified with both of *mun*'s activities?
 20. How does the directional sense of projection and reflection stand to the recognising-and-fulfilling sense and to the third use in which understanding is reflection and making-understood is projection (SB, pp. 63–64; KD, §3.12, p. 110)? Insentient nature is said to have projection only while sentient nature has both (SB, p. 60), so the pair also carries ontological work that the directional reading does not cover.
 21. How do knowing, believing, recognising, and fulfilling stand to the paired activities and the six sentient activities? The fourfold divides across the cognisance–sensitivity axis, knowing and believing on the one side and recognising and carrying out on the other (KD, §3.4, p. 66), but no consulted passage assigns its members to faculties or to the six.
 22. Is a deluded organisation *sanskar* or not? One formulation makes delusion under animal consciousness *kusanskar*; another holds that wrongs are never accepted and so never become *sanskar*. Which reading governs what re-embodiment carries (Editorial Notes)?
 23. Visualisation formed without the enlightenment of truth necessarily carries the flaws of excess, deficiency, or omission (MVD, p. 286). Is that a further specification of the four and a half activities, or a separate account of deluded *chitran* alongside the jurisdictional restriction of *tulan* (§8)?
 24. The total is decomposed as $2 \times (1 + 2 + 8 + 18 + 32)$, whose inner terms are positions in the nucleus and the four orbits (§9). The four orbital terms are the shell capacities $2n^2$ for $n = 1$ to 4. Nothing in MVD, SB, JV, or AVD states that correspondence or argues the positions from anything more basic, the general account of atomic constitution saying only that each orbit holds one or more particles (MVD, p. 78). Is the correspondence intended?
 25. Among *mun*'s thirty-two pairs the sensory ones cover touch, temperature, the six tastes, smell, and visible form, but sound appears only inside a definition and not as a pair of its own (MVD, pp. 343, 347–348). Does that omission follow from the enumeration's principle, and does it bear on naming the four sensory activities sought in question 1?

Appendix A. The control model formalised

A.1 What this appendix is

Everything in this appendix is the model's construction rather than the sources' statement. The body of the note states what the primary texts establish; the machinery below makes that reading definite enough to reason with, and in doing so commits to structure the sources neither assert nor exclude. Each section names the commitment it introduces. The appendix can be rejected in whole or in part without disturbing the body, and §11.2 keeps the corresponding questions open.

The formalism uses typed sets, ordered transformations, partial functions, and qualitative predicates. It does not assume a metric on understanding, a numerical quantity of *bal* or *shakti*, a scalar reward, or an experimentally identified transfer function. The time index t orders successive embodied cycles; it is not a claim that the activities of *jeevan* are clocked computations.

A.2 State and content spaces

Commitment: that the state of jeevan can be represented as a product over faculties, and that persistent and presently active content can be separated as coordinates.

Let the ordered set of faculties be:

$$F = \{a, b, c, v, m\} = \{atma, buddhi, chitta, vritti, mun\}.$$

Each faculty $f \in F$ has a qualitative state space $X(f)$, and the internal state of *jeevan* is the product:

$$\begin{aligned} X(J) &= X(a) \times X(b) \times X(c) \times X(v) \times X(m), \\ X(J, t) &= (x(a, t), x(b, t), x(c, t), x(v, t), x(m, t)). \end{aligned}$$

The coordinates are typed contents, not real-valued variables. Each $x(f, t)$ has a persistent aspect $s(f, t)$, carried as *sanskar*, and a presently active aspect $q(f, t)$:

$$x(f, t) = (s(f, t), q(f, t)), \quad X(J, t) = (S(J, t), Q(J, t)).$$

The decomposition is analytical rather than spatial: $S(J, t)$ and $Q(J, t)$ are not two stores inside *jeevan*. $S(J, t)$ is the durable cross-faculty organisation through which $Q(J, t)$ is interpreted and projected. The content space may be partitioned as:

$$D = D(O) \cup D(R) \cup D(P) \cup D(E),$$

where $D(O)$ concerns coexistence, identity, and the *jeevan-body* distinction; $D(R)$ concerns relationship, purpose, value, *niyam*, *niyantran*, and *santulan*; $D(P)$ contains the twelve

practical knowledge domains; and $D(E)$ contains retained meanings, prior results, expectations, and tendencies. A content $d \in D$ becomes operative *sanskar* only through its distributed organisation across the five state dimensions.

A.3 Motion, its direction, and embodied dynamics

Commitment: that projection is the ordered composition of the outward-set motion activities, and that receptivity is a two-valued predicate gating the cascade.

Motion carries a direction parameter, because the same *shakti* activity is set outward in projection and inward in *antarniyaman* (§§4, 6.3). Let:

$$\Sigma = \{\text{out}, \text{in}\}, \quad S : F \times \Sigma \rightarrow \text{operations},$$

so that $S(f, \text{out})$ carries the established state of f toward the faculty outward of it, while $S(f, \text{in})$ carries no content and instead raises the receptivity of f to the faculty inward of it. Write $\text{in}(f)$ for the faculty immediately inward of f and $\text{out}(f)$ for the one immediately outward, with $\text{in}(a)$ and $\text{out}(m)$ undefined within *jeevan*.

Let $\kappa(f, t)$ be the condition attaching to level f —absence of crime at m , of injustice at v , of attachment at c , of ignorance at b —and let:

$$r(f, t) = S(f, \text{in})(x(f, t), \kappa(f, t)) \in \{\top, \perp\}.$$

$r(f, t) = \top$ means that f can receive the signal of $\text{in}(f)$ at t . This makes the effective cascade a consequence rather than a stipulation: f belongs to $F^{\text{eff}}(t)$ only if receptivity holds along the chain from f inward, which is the formal counterpart of the three statuses of *buddhi* in §4.1.

Let $c(t)$ denote the present context: purpose, relationship, bodily condition, available means, and circumstance. Projection is the ordered composition of the five outward-set motion operations, written $P(f) = S(f, \text{out})$:

$$P(t) = P(m) \circ P(v) \circ P(c) \circ P(b) \circ P(a), \quad p(t) = P(t)(X(J, t), c(t)),$$

with $P(a) = \text{pramanikta}$, $P(b) = \text{sankalp}$, $P(c) = \text{chitran}$, $P(v) = \text{vishleshan}$, and $P(m) = \text{chayan}$.

The displayed composition is the full-depth cascade. More generally, let $F^{\text{eff}}(t) \subseteq F$ be the faculties effectively participating in the present cycle; projection is composed only over that ordered subset. If *atma* and *buddhi* are not effectively governing:

$$F^{\text{eff}}(t) = \{c, v, m\} \implies P(t) = P(m) \circ P(v) \circ P(c).$$

This lower-depth cascade can still produce imagination, analysis, selection, and skilled behaviour, but the model does not insert fictitious *pramanikta* or *sankalp* where *anubhav* and *bodh* are not effective. That full-depth intrinsic recurrence can proceed with no embodied occasion at all is an extension of the attested shallow case of dream (§6), not a source statement.

Thus $p(t)$ is the selection made available to *medhas*; it is not yet the bodily act. Let $B(t)$ denote the present body and $E(t)$ the relational, social, material, and natural field:

$$(B(t+1), E(t+1)) = G(B(t), E(t), p(t)), \quad y(t+1) = H(B(t+1), E(t+1)).$$

G includes bodily execution, speech, work, interaction, and material change. H makes bodily condition, sensory signal, performed action, material result, and another person's response available as feedback.

A.4 Inquiry, response, and state update

Commitment: that samvahan, sambodhan, and samvartan operate as a request-and-response protocol between adjoining faculties, and that every embodied result is converted into an inquiry. No consulted passage assembles the six sentient activities this way (§6.1).

Feedback $y(t+1)$ is not copied unchanged into the internal state, and it is not carried inward as content at all. It occasions an inquiry. Let $I(f)$ be the inquiries that can be raised at level f , and let:

$$\text{Occ} : Y \times X(J) \rightarrow I(m), \quad \iota(t+1) = \text{Occ}(y(t+1), X(J, t)).$$

Samvahan bears an inquiry to the adjoining inward level, and *sambodhan* returns the understanding of reality when the inner level's state can answer it:

$$\text{Samvahan}(f) : I(f) \rightarrow I(\text{in}(f)),$$

$$\text{Sambodhan}(f) : X(\text{in}(f)) \times I(\text{in}(f)) \rightarrow C(f),$$

where $C(f)$ is the content that becomes available at f . Both are gated by receptivity: $\text{Sambodhan}(f)$ is defined only where $r(f, t) = \top$. An inquiry may therefore be borne inward and go unanswered at a level whose receptivity condition fails, which is the formal counterpart of §6.3 and has no analogue in a scheme where reflection is projection reversed. The outer faculty's own uptake of what returns is *samvartan*:

$$\text{Samvartan}(f) : X(f) \times C(f) \rightarrow X(f).$$

Reception and change are thus separate events, and the composite inward pass over the effectively participating levels is the reverse ordered composition:

$$R(t) = R(a) \circ R(b) \circ R(c) \circ R(v) \circ R(m), \quad z(t+1) = R(t)(\iota(t+1); X(J, t)).$$

The argument is the raised inquiry rather than the feedback itself, and each $R(f)$ is the establishing *bal* activity of its level: $R(m) = \text{asvadan}$, $R(v) = \text{tulan}$, $R(c) = \text{chintan}$, $R(b) = \text{bodh}$, and $R(a) = \text{anubhav}$. In a shallower cycle, reflection terminates at the highest effectively participating faculty, so that for $F^{\text{eff}}(t) = \{c, v, m\}$ feedback can alter valuation, judgment, and representation without reaching definiteness or realisation.

Each map changes the type of content: the raised inquiry becomes valuation, valuation comparative judgment, judgment recognised meaning, recognised meaning definiteness, and definiteness realised concurrence. No stage relays the feedback itself. The *bal*-side update may be represented as:

$$Q(J, t + 1) = U^Q(Q(J, t), z(t + 1); S(J, t)),$$

$$S(J, t + 1) = U^S(S(J, t), z(t + 1)) \quad \text{when the content is assimilated,}$$

with $S(J, t + 1) = S(J, t)$ when the content remains transient. The distinction prevents every passing sensation or thought from being counted as a permanent change of *sanskar*. U^S may confirm, extend, or reorganise lower-faculty valuation, criteria, representation, and application; it cannot manufacture an incorrect *bodh* or *anubhav*.

A.5 Correctness and incompleteness constraints

Commitment: that bodh and anubhav are formalised as partial functions whose definedness entails agreement with reality.

Let K denote reality as the Knowledge-reference with which content must agree:

$$\text{Bodh} : X(c) \rightarrow X(b), \quad \text{Bodh}(c) \downarrow \Rightarrow \text{Agree}(c, K) = \top,$$

$$\text{Anubhav} : X(b) \rightarrow X(a), \quad \text{Anubhav}(b) \downarrow \Rightarrow \text{Agree}(b, K) = \top.$$

Here $\downarrow$ means that the function is defined for the presented content. If $\text{Agree}(c, K) = \perp$, $\text{Bodh}(c)$ is undefined: the candidate remains assumption, judgment, or unresolved meaning rather than becoming incorrect *bodh*. The same restriction excludes incorrect *anubhav*, so that $\text{WrongBodh} = \emptyset$ and $\text{WrongAnubhav} = \emptyset$.

Incompleteness is represented by restricted effective reach. Let $\Delta(b)$ be the topics in D for which *bodh* is effective and $\Delta(a)$ those for which *anubhav* is effective:

$$\Delta(a) \subseteq \Delta(b) \subseteq D.$$

The reach is incomplete when either inclusion is proper, or when established definiteness and realisation fail to govern $P(c), P(v), P(m)$. “Incomplete *buddhi* or *atma*” therefore means incomplete effective reach, activation, coordination, or evidential expression—not partially false *bodh* or *anubhav*. This formalisation says nothing about the condition of *buddhi* where *bodh* is undefined, which §5.2 treats separately.

A.6 Reference flow, qualitative error, and successful regulation

Commitment: that immersion is a two-valued predicate per level, that its correspondence with adjoining concurrence is a biconditional, and that thirst is an existential quantification. The sources give a correspondence and a causal account; the logical form is the model's.

Let $A(f, t)$ hold when immersion is present at level f :

$$A : \{b, c, v, m\} \times T \longrightarrow \{\top, \perp\},$$

with the four values as its names at the four levels: $bliss = A(b)$, $contentment = A(c)$, $peace = A(v)$, $happiness = A(m)$. Because a value is the concurrence of its level with the level inward of it:

$$A(f, t) = \top \iff H(f, \text{in}(f)) = \top.$$

Discord and the drive follow:

$$\text{Vish}(f, t) = \neg A(f, t), \quad \text{Trisha}(t) = \top \iff \exists f \in \{b, c, v, m\} : \neg A(f, t).$$

The system is therefore driven by the absence of its reference rather than by a computed reward, and Trisha requires no separate motivational term: the developmental gradient guarantees that outward-set governance leaves some $A(f, t)$ false. Restfulness is the condition $\forall f : A(f, t) = \top$. Question 17 in §11.2 asks what would distinguish a value's failing at a level from its reaching further in attenuated form, which this formalisation forecloses by construction.

The evaluation of an embodied result is a second and independent judgment:

$$e(t+1) = E(y(t+1); K, \rho(t), \mu(t)) \in \{\text{agreement, unresolved, contradiction}\},$$

where $\rho(t)$ is the accepted relationship and purpose and $\mu(t)$ the requirement of mutual fulfilment. With $H(m, v), H(v, c), H(c, b), H(b, a)$ the harmonies across the four couplings and $M(t)$ mutual fulfilment in the controlled field, successful regulation is:

$$\Phi(t) = H(m, v) \wedge H(v, c) \wedge H(c, b) \wedge H(b, a) \wedge M(t) = \left(\bigwedge_{f \in \{b, c, v, m\}} A(f, t) \right) \wedge M(t).$$

$\Phi(t) = \top$ is not the maximisation of pleasure or utility. It says that the immersion reaches every level, the projection accords with the realised and definite reference, and the embodied result is mutually fulfilling. The second conjunct is not redundant: a *jeevan* whose internal levels are in concurrence still acts through a body and a field, and competence, means, and another person's response are not settled by internal coherence (§10).

A.7 Bodily death, re-embodiment, and observability

Commitment: that the persistent organisation is carried across embodiments as a modelled object. The sources state that the same jeevan continues with its attained understanding; they do not speak of coordinates.

Index bodily embodiments by n , and let t^{death} be the end of the present coupling. Let $\sqsubseteq$ denote that the organisation on the left is carried into the state on the right without specified loss:

$$S(J, n, t^{\text{death}-}) \sqsubseteq S(J, n+1, 0), \quad B(n+1) \sqsupseteq B(n).$$

Whether $\sqsubseteq$ can be strengthened to equality is left open, and question 23 in §11.2 bears on it: if a deluded organisation is not *sanskara* at all, the carried state contains less than $S(J)$ represents. Neither relation implies explicit autobiographical recall. Later behaviour is:

$$o(n+1, t) = O(S(J, n+1), Q(J, n+1, t), B(n+1, t), E(n+1, t)).$$

For an observed behaviour o , the inverse $O^{-1}(o)$ is non-unique: multiple combinations of carried *sanskara*, present learning, bodily disposition, circumstance, and current selection can produce observationally similar conduct. The model therefore represents continuity without claiming that behaviour alone can identify which part of the state was acquired in an earlier embodiment.

A.8 Pair-level state and motion semantics

Commitment: the functional characterisation of individual pairs below. The 61/61 partition itself is the source's, tabulated by column at AVD, pp. 91–94 and stated in the body at §9.1; what the appendix adds is a reading of what each side of a pair does.

The 61 state activities are typed articulations of the qualitative internal state, and the 61 motion activities their paired transition, projection, and evidencing operations. The examples below are interpretations, not source labels:

Pair	State-side interpretation	Motion-side interpretation	Evidential closure
<i>Dheerata–veerata</i>	Firmness and dedication toward justice established in <i>vriddhi</i>	Physical and intellectual powers deployed to enable justice for another	Justice protected or restored in relationship
<i>Mamata–udarata</i>	Affinity and care established as valuation in <i>mun</i>	Bodily, intellectual, and material means selected gladly for right use	Another's awakening, health, or prosperity supported without exploitation
<i>Daya, krupa, and karuna</i> activities	Another's development is understood as relevant to one's own participation	Readiness, capability, inspiration, and help become effective in mutuality	Capability and receptivity for prosperity or awakening increase

These examples show why “development of *bal*” should mean refinement of state content, criterion, coordination, and effectiveness—not accumulation of a larger quantity of power.

A.9 A worked cycle

Commitment: the phase decomposition below is the model's, applied to an ordinary situation for illustration.

Consider disagreement over the use of family resources.

Phase	Operation in the human joint form
Reference	The relationship is to be fulfilled justly; material means are for need, prosperity, and right use rather than domination or hoarding
Relevant known content	Bodily need, the sensory and material facts of the situation, the rightful structure of <i>vitteshana</i> and family continuity, and the possibility of <i>upakar</i>
Disturbance	Competing needs, limited resources, prior expectations, emotional reactions, and bodily conditions create a decision situation
Initial feedback	<i>Mun</i> registers attraction, discomfort, satisfaction, dissatisfaction, and the responses of family members
Deliberation	<i>Vritti</i> considers pleasantness, health, and material consequence under justice, <i>dharma</i> , and truth
Meaning formation	<i>Chitta</i> recognises the relationship, values, purpose, and form of mutual fulfilment
Validation	<i>Buddhi</i> reaches <i>bodh</i> : the understood purpose and just course are definite rather than merely asserted
Commitment	<i>Sankalp</i> establishes the resolve to organise conduct according to that understanding
Planning and selection	<i>Chitta</i> forms a plan, <i>vritti</i> analyses alternatives, and <i>mun</i> selects words, timing, and action
Embodied execution	The selection is communicated through <i>medhas</i> and body as speech, work, restraint, exchange, or provision
Result	Resources are used and the relationship changes in response to the act
Closure	Both parties evaluate whether values were fulfilled and mutual satisfaction attained; remaining contradiction becomes feedback for another cycle

Knowledge becomes evidence only when the projected act and evaluated result agree with the governing reference. Correct intention is necessary but not sufficient: the action must competently fulfil the relationship, and its result must remain open to evaluation and correction. The cycle begins with prior expectations because an embodied cycle never begins from nowhere; within the model those expectations can include organisation carried by *jeevan* from an earlier embodiment as well as learning from the present family and society.

Editorial Notes

The two grains of *bal* and *shakti*

The sources use strength and power at two different grains, and the difference is not a translation artefact. At the level of the activity, “the strength and power of an entity manifest in its state and motion, respectively” and state activities are strengths while motion activities are powers (JV, pp. 40, 62), the plane of a unit is determined by its form, essential nature, and inherent strength and power, and “this itself is its state and motion” (MVD, p. 131), and the 122 activities are found “in the form of strength & power or state & motion” (MVD, p. 323). At the level of the faculty, the five faculties themselves are the strengths and the five orientations the powers: a sentient unit “has five indivisible strengths: *mun*, *vriddhi*, *chitta*, *buddhi*, and *atma*”, which is “hope, thought, desire, resolve, and realisation in existence, respectively” (MVD, p. 275), the vibrational motion in *jeevan* is “in the form of five inexhaustible strengths and powers” (MVD, p. 199), and consciousness “encompasses inexhaustible strengths such as *mun*, *vriddhi*, *chitta*, *buddhi*, and *atma*, along with inexhaustible powers such as hope, thought, desire, resoluteness, and evidence” (SB, p. 63).

Both grains appear within SB, so the difference is not one book’s usage set against another’s. At p. 139 the activity-level naming is explicit and given faculty by faculty: ten activities, five functioning in the form of strength and five in the form of power, with strength and power becoming evident as state and motion in the awakened human. The assignment there is asymmetric. Each faculty’s *shakti* is named by the outward member alone—*chayan* for *mun*, *vishleshan* for *vriddhi*, *chitran* for *chitta*, *sankalp* for *buddhi*, *pramanikta* for *atma*—which is the *shakti* column of §5 exactly. Each faculty’s *bal* is named by the pair taken whole: *manobal* recognised in taste and selection, *vriddhi bal* in deliberation and analysis, *chitta bal* in contemplation and visualisation, *buddhi bal* in enlightenment and resolve, *atmabal* in realisation and authenticity. The verbs follow the terms—*bal* comes to be recognised, *shakti* becomes evidenced—which matches JV p. 62, where motion activities are evidenced in mutuality and state activities are realised within oneself.

The two grains are given together in one passage, which is what allows them to be read as one scheme. *Mun*, *vriddhi*, *chitta*, *buddhi*, and *atma* are the five inexhaustible *bal* and hope, thought, desire, resoluteness, and authenticity the five inexhaustible *shakti*; two sentences later *asvadan*, *tulan*, *chintan*, *bodh*, and *anubhav* are themselves named as those five *bal*, always present in *jeevan* for manifestation (AVD, p. 151). The tabulated enumeration puts the same relation in columns: the faculty is the name of the *bal*, the orientation the name of the *shakti*, and the activities of each stand respectively under *pratyavartan* and *paravartan* (AVD, pp. 91–94). Read so, the faculty is the *bal* and its reflective activity is that *bal*’s activity, while the orientation is the *shakti* and its projective activity is that *shakti*’s activity. Desire accomplishes visualisation, thought analysis, and hope selection, exactly as the column layout requires (AVD, p. 85).

This note therefore adopts the activity-level reading without treating it as a rival to the faculty-level one. What the reconciliation does not cover is the naming at SB, p. 139, where each faculty's *bal* is recognised in the pair taken whole—*manobal* in taste and selection together—rather than in the reflective member alone. The same book runs the identification the other way at p. 80, where *manobal* manifests itself as hope-*shakti* and is identified with the activities of selection and taste, so that *bal* and *shakti* name one thing seen in state and in motion rather than two members of a pair. That is a difference of emphasis rather than of assignment, and the passages consulted do not settle it (§11.2).

One consequence reaches §4. The state–motion axis and the projection–reflection axis are held distinct there as analytical axes, because the note uses direction to describe traversal of the stack as well. At the level of the individual activity they coincide, which is why Appendix A.3 and A.4 compose projection out of the motion activities and reflection out of the state activities (§9.1).

Projection and reflection in the recognising-and-fulfilling account

§§1 and 6 define projection as the movement outward from *atma* toward *mun* and the body and reflection as the movement inward. The corpus uses the same pair at two further grains. In one, the reflection and projection of the sentient powers “are actualised in recognising and fulfilling”; consciousness “in its projection, recognises form and properties” and “fulfils through its reflection”; the physical and chemical world “comes into recognition in the course of projection through sensory contact”, whereas “values and existence — or essential nature and *dharma* — are recognised only in reflection” (SB, pp. 63–64). Here projection reaches outward to sensory contact and returns form and property, which the note’s exclusively inner-to-outer definition does not accommodate. In the other, the pair separates understanding from teaching: by the reflection method we understand and by the method of making understood we are projected, with projection at the root of all human activity and reflection at the root of projection (KD, §3.12, p. 110). The pair also carries ontological weight that direction alone does not, since insentient nature has projection only while sentient nature has both (SB, p. 60).

The note does not attempt to reconcile the three. It keeps the directional definition, which MVD p. 275 and p. 307 support, and records the others as further uses of the same terms whose relation to the first is unsettled (§11.2).

The fourfold the recognising-and-fulfilling account belongs to — knowing, believing, recognising, and fulfilling — is not developed in this note. It bears directly on §4.2, since *sanskar* is described as “the process of knowing, believing, recognising, and becoming evident in the form of fulfilling”, and “the entirety of human *sanskar* is precisely the processes of knowing, believing, recognising and fulfilling” (SB, p. 237). Two further passages place the fourfold within the architecture modelled here. It divides across the cognisance–sensitivity axis, knowing and believing falling to cognisance and recognising and carrying out to sensitivity, with the awakened human keeping sensation under control by means of cognisance (KD, §3.4, p. 66). And awakening is stated as the joining of the two halves: it “cannot happen un-

less and until we connect our activities of recognising and fulfilling, with our activities of knowing and believing”, the four and a half activities having so far been evidenced through recognising and fulfilling sensory desires alone (JV, p. 74). The fourfold is therefore a second description of the transition §8 describes through the count of activities. A treatment of it, and of how its members stand to the paired activities, is left to later work (§11.2).

***Sakshatkar* and the activity it names**

§6.2 uses *pratiti*, *aabhas*, and *bhas* for the forms realisation takes at successive couplings, and *chintan* is the awareness of truth (MVD, pp. 99–100, 316). *Sakshatkar* has no place of its own in that sequence. It appears instead as what affirmation of truth becomes when study reaches *chitta*—ratiocination in *mun*, deliberation in *vriddhi*, *sakshatkar* in *chitta*, enlightenment in *buddhi* (MVD, p. 126)—and as the *sakshatkar* of enlightenment and resolve, which is called realisation-based contemplation (MVD, p. 99). Both placements put it where *chintan* already sits. The recorded session treats it as the one thing a seeker works at, with *bodh*, *anubhav*, and *praman* following of themselves.

The note therefore uses *chintan* for the activity at that locus and introduces no separate *sakshatkar* stage. Whether *sakshatkar* names *chintan* under another aspect or the moment at which study succeeds is recorded at §11.2.

The two formulations of the four values

Bliss, contentment, peace, and happiness are given in two ways, and this note treats them as one account rather than as variants to be chosen between. At MVD p. 307 the four are the names of a single immersion at the levels of *buddhi*, *chitta*, *vriddhi*, and *mun*. At MVD p. 327 the same four are what the concurrence of adjoining activities yields: *buddhi* with *atma*, *chitta* with *buddhi*, *vriddhi* with *chitta*, *mun* with *vriddhi*. The two lists correspond term for term, because the value named at a faculty is the value of that faculty’s concurrence with the faculty inward of it. §3.1 states the correspondence and uses both passages; no reconciliation beyond the correspondence itself is asserted.

The reflection sequence at MVD p. 307—*mun* in *vriddhi*, *vriddhi* in *chitta*, *chitta* in *buddhi*, *buddhi* in *atma*, *atma* in Omnipresence—runs in the same order as the immersion, inward. §6.3 follows it. The note does not claim that immersion and *pratyavartan* are the same activity, only that they traverse the same couplings.

Where the manifest orientations are located

Asha, *vichar*, *ichha*, *sankalp*, and *praman* are located at the faculties in §5. MVD p. 276 supports that placement, giving hope in *mun*, thought in *vriddhi*, desire in *chitta*, and expectation in *buddhi*, and the tabulated enumeration supports it again, setting each orientation on its own faculty’s row as the name of that faculty’s *shakti* (AVD, p. 91). MVD p. 275 locates the same five at the couplings instead: hope between the gross body and *mun*, thought between *mun* and *vriddhi*, desire between *vriddhi* and *chitta*, resoluteness between *chitta* and *buddhi*, and

evidence between *buddhi* and *atma*. The note adopts the faculty placement and records the coupling placement here. The sources are not harmonised on this point and the note does not assert that one placement subsumes the other.

What these five are, as distinct from where they sit, is settled by the same table: they are the *shakti* whose *bal* is the faculty they stand on (AVD, pp. 91, 151). §5 calls them manifest orientations, which names their role in the loop rather than their standing in the strength-and-power scheme.

Sanskar and the place of atma

MVD p. 121 states that *sanskar* in the sentient aspect “is in the form of attaining the awakening of *mun*, *vritti*, *chitta*, & *buddhi*”, and p. 315 that awakening in the sentient aspect is itself *sanskar*. Four faculties are named; *atma* is not among them. §4.2 accordingly restricts acquired organisation to those four and gives *atma* a different role, as the realisation with which acquired content comes to agree and from which authenticity is projected.

That role is not the absence of a role. Realisation in coexistence is the complete development of *atma* (MVD, p. 323), *bodh* becomes effective when *buddhi*’s reflection reaches it (MVD, p. 286), and the immersion that names the four values arises from it (MVD, p. 307). The distinction drawn is between content acquired through environment, study, and practice, which the sources place in the four, and realised reference, which they place at the centre. Whether the darshan would accept that distinction, or would regard the awakening of the four as including *atma* implicitly, is not settled by the passages consulted.

Susanskar, kusanskar, and wrongs that are not accepted

Two passages pull in different directions on whether a deluded organisation is *sanskar* at all. MVD treats it as one kind of *sanskar*: awakening in the sentient aspect is *susanskar*, “while delusion due to animal consciousness itself is *kusanskar*” (p. 315), and *kusanskar* is “the tendency of living like animals”, the thoughts and practices that frustrate development (p. 94). JV denies the category: *sanskar* is the combined form of understanding, honesty, responsibility, and participation, and “since wrongs are not acceptable to anyone, they do not become *sanskar*. No one accepts wrongs but remains ensnared by them. Even if a person has committed a thousand wrongs, those wrongs remain” (p. 49).

The difference may be one of criterion — MVD classifying by what in fact organises conduct, JV by what a person can accept — but the sources do not say so, and the note does not assert it. §4.2 follows MVD in treating the organisation as evaluable and directional, and §10 treats deluded operation as a partially effective loop rather than as an absence of organisation. On JV’s formulation the deluded person is ensnared by wrongs that never became *sanskar*, which would make the carried state of Appendix A.7 contain less than $S(J)$ represents. The question bears on what re-embodiment carries and is recorded at §11.2.

The four and a half activities

Two passages fix the fraction, and they agree. Deluded humans of the knowledge order have “selection and taste activities in *mun*; analysis and deliberation activities towards pleasure, health, and profit in *vrutti*; and visualisation activity in *chitta*”, constituting the four and a half activities by way of delusion (MVD, p. 89). The half is named directly elsewhere: “These four and a half activities are selection, taste, analysis, visualisation, and half of deliberation. ... Deliberation, based on sensitivity, operates from the perspective of pleasure, health, and profit” (JV, p. 73).

The half therefore falls on *tulan* in *vrutti*, because deliberation runs under only the first three of the six evaluative perspectives (MVD, p. 66). *Chitta* contributes exactly one activity, visualisation, with contemplation absent; *buddhi* and *atma* contribute none. The arithmetic matches the constitutional description of activeness in the fourth, third, and second orbits (MVD, p. 79).

What the half restricts is stated in the direction of jurisdiction: deliberation confined to the pleasant, health, and profit does not become the content of contemplation, and selection made on those terms is accomplished entirely within the four and a half (AVD, p. 152). §8 follows that reading, which is why contemplation is absent rather than partial. The sources also speak of effectiveness for the set of ten (JV, p. 73) and describe the same transition through the fourfold, awakening requiring that recognising and fulfilling be connected to knowing and believing where the four and a half have been evidenced through sensory desires alone (JV, p. 74). Whether the flaws that visualisation necessarily carries without the enlightenment of truth (MVD, p. 286) extend the fraction to *chitran* or stand beside it as a separate account is recorded at §11.2.

The twelvefold practical schema

The twelvefold division of practical knowledge is given in Shri A. Nagraj’s oral expositions, where the knowledge *jeevan* organises and applies is presented as these twelve aspects. It is not a construction of this note. What the note cannot yet do is anchor it in the printed sources consulted here: no passage in MVD, SB, or JV enumerates the twelve as a set, and the recorded session held in [References/Madhyasth-Darshan/Nagraj-Recorded-Sessions/](#) is not one in which the enumeration appears.

The component groups are attested individually. The four bodily propensities appear as the innateness of the heart (MVD, p. 204) with their point of effect at p. 305; the three *eshanas* appear at p. 305 as nourished by awakened thought; *upakar* is distributed across the detailed activities of *chitta*, *vrutti*, and *mun* (pp. 328–348). The fourth group is the one still unanchored in print: the five modalities of sound, touch, visible form, taste, and smell are named repeatedly, and sensory activity appears among the detailed activities of *mun* and as *samvedna* in *vrutti* (p. 337), but a set of four sensory activities is not enumerated and this note does not supply names for them. §7 therefore presents the twelve as governing content while marking the four sensory activities as awaiting their source-Hindi names.

One lead is worth recording without being pressed into a claim. The sensory pairs closing *mun*’s thirty-two cover four modalities—touch with temperature, the six tastes, smell, and visible form—while sound appears only inside the definition of *priya* and not as a pair of its own (MVD, pp. 343, 347–348). Whether those four are the four sensory activities of the twelvefold, or the coincidence of number is accidental, the passages consulted do not say (§11.2).

The two-tier reading of the reference structure

§3.3 presents *niyam*, *niyantran*, and *santulan* as the reference structure at the level of Knowledge and justice, *dharma*, and truth as the governing criteria for humane conduct. MVD p. 174 presents these not as two tiers but as one unbroken identity chain running from knowledge through law, regulation, and balance into justice, *dharma*, and truth. The two-tier presentation is this note’s layering, adopted because a control model distinguishes reference facts from evaluative criteria. The distinction is analytical and is not claimed for the source.

Terms that resemble one another

Several terms are close enough in form to be read as one, and the model depends on keeping them apart.

Term	Where it belongs	Not to be read as
<i>Medhas</i>	The brain and neural mediation at the embodied interface (MVD, p. 200; §2.1)	<i>Medha</i> , “the carrier-bearer activity of memory”, a named detailed activity of <i>chitta</i> (MVD, p. 330)
<i>Samvedan</i>	Sensing: knowledge of the five cognitive and five work organs, and the tendency for development — one of the six activities of the sentient aspect (MVD, p. 313; §6.1)	<i>Samvedna</i> , a named detailed activity of <i>vritti</i> (MVD, p. 337)
<i>Samvahan</i>	Enquiring: the bearing of inquiries for knowledge of completeness (MVD, p. 314; §6.4)	<i>Samvahan</i> as bearability, a tactile property of objects under the activities of the cognitive and work organs (MVD, p. 347)
<i>Sanrakshan</i>	Protecting: paving the way towards development (MVD, p. 314; §6.1)	<i>Sanrakshan</i> as protection in the organ-level sense of removing obstacles for ease (MVD, p. 347)
Sensitivity as the pair-term of cognisance	The sense-rooted mode of governance contrasted with cognisance throughout §§3.2, 7.1, and 8	The English gloss the source gives for <i>samvedna</i> at MVD p. 337, which is also “Sensitivity”

The *samvedna* entry is worth reading whole, because the note draws on only part of it. It is given as movement for completeness; work, behaviour, and thought performed in accordance with the law-triad; “the pain towards development and awakening, as quest, expectation, hope”; the spontaneous objective and process of *jeevan* for believing what is known and fulfilling what is recognised; the activity of grasping external signals through all cognitive organs; and readiness for participation in orderliness (MVD, p. 337). §6.4 uses the third of these for the inward-facing register. The fifth cuts the other way, giving *vritti* a signal-grasping activity of its own, and the fourth is the knowing–believing–recognising–fulfilling four-fold recorded above. The note does not treat *vedana* as a term distinct from *samvedna*; the source phrase is a single entry.

Cited: the intellectual means as capacity, ability, and receptivity (p. 62; §4.1); bodily, sensory, intellectual, and higher-human fields (pp. 65–68; §§3, 7.1); the six evaluative perspectives with the referents against which each becomes clear (p. 66; §§5.4, 8); restfulness as the eradication of unhappiness and the ultimate goal of the universe, with every deluded human anxious for it (p. 68; §§3, 3.2); *aplavan* as the effect of delusionlessness, and the inward-facing series of curiosity, enthusiasm, delight, elation, and realisation with the inward regulation of energies it requires (pp. 77–78; §§3.1, 6.4); *jeevan* as a constitutionally complete atom with *atma* as nucleus and the four faculties as orbital groups, each orbit holding one or more particles, and *kautuhal* placed in *mun* (p. 78; §§1, 11.1, 11.2); no lack of effort until capacity, ability, and receptivity for restfulness are developed, and *kshobh* as the shortcoming in converting capacity into effort (pp. 78–79; §§3, 3.2); the four and a half activities as activeness in the fourth, third, and second orbits (p. 79; §8, Editorial Notes); every human’s thirst for understanding as the evidence that receptivity is present in all humans (p. 88; §11.2); the enumeration of the four and a half as selection and taste in *mun*, analysis and deliberation towards pleasure, health, and profit in *vritti*, and visualisation in *chitta* (p. 89; §8, Editorial Notes); the four descriptions of *sanskar* and bodily heredity distinguished from *sanskar* in the sentient aspect (p. 90; §4.2); what is carried forward as *prarabdh* (pp. 90–91; §§4.2–4.3); constitutional complete-

ness as release from molecular and weight bondage with retention of the bondage of hope, frustration of effort as the cause of development issuing in the thirst for restfulness, and decline where a unit's powers flow outward against development where they are turned inward (p. 91; §§1, 3.2, 4); *kusanskar* as the tendency of living like animals, frustrating development (p. 94; Editorial Notes); the *sakshatkar* of enlightenment and resolve as realisation-based contemplation, and *pratiti*, *aabhas*, and *bhas* as the awareness, comprehension, and perception of realisation at successive couplings (pp. 99–100; §§6.2, 11.2, Editorial Notes); bliss as the immersion of the truth-realised *atma* upon *buddhi* (p. 101; §3.1); *sanskar* in the sentient aspect as the attained awakening of *mun*, *vrutti*, *chitta*, and *buddhi*, with *prabhav* and *fal* (p. 121; §4.2, Editorial Notes); affirmation of truth through study as ratiocination in *mun*, deliberation in *vrutti*, *sakshatkar* in *chitta*, and enlightenment in *buddhi* (p. 126; §11.2, Editorial Notes); the plane of a unit determined by form, essential nature, and inherent strength and power, this itself being state and motion (p. 131; §4, Editorial Notes); each unit situated in its plane according to capacity, ability, and receptivity (p. 132; §4.1); the trio arising from the interconnected process of environment, study, and prior *sanskar*, with movement toward awakening or decline depending on them (p. 134; §4.1); the extent of receptivity constituting one's qualification (p. 142; §§4.1, 11.2); the chain from endeavour through capacity, study, receptivity, and ability to the practice of literature, behaviour, and work (p. 144; §4.1); realisation's effect as immersion in *buddhi*, *chitta*, *vrutti*, and *mun*, and awakening at each level continuing until the capacity belonging to it is attained (pp. 155–156; §§3.1, 6.3); Knowledge, law, regulation, and balance continuing into justice, *dharma*, and truth (p. 174; §§2.2, 3.3, Editorial Notes); vibrational motion in *jeevan* as five inexhaustible strengths and powers (p. 199; §1, Editorial Notes); orbital motion under attraction and retraction, the wave conveyed to *medhas* through which knowledge unfolds, and the impetus as a wave in the *prana* air bearing the effect of *mun* (p. 200; §§2.1, 4.1, 11.1); the innateness of each faculty and of the heart, the *prana*–heart–organ chain, the three bodies with *prana* coupling gross to subtle and *chitta* coupling subtle to causal, and ego as *buddhi* alienated from *atma* (pp. 204–205; §§2, 2.1, 5.4, 5.5, 10); the order-level contrast with all human lives engaged in sequential events of *sanskar* (p. 211; §4.2); the per-faculty perturbation taxonomy extending outward through *prana*, heart, and body (pp. 216–217; §§5.2, 6.3, 10); the mutual evaluation of receptivity and ability, one side having a greater or lesser degree than the other, and study imparted according to the disciple's need and inquiry (p. 248; §§4.1, 11.2); form, properties, essential nature, and *dharma* as what a comprehensive study of any unit covers (p. 273; §11.2); the five indivisible strengths of a sentient unit, *avartan* as the combined form of reflection and projection and the awakened *jeevan* cycle, the deluded sense-rooted sensitivity system, the developmental gradient and the discord, frustration, and thirst for restfulness it causes, and the inspiration chain (pp. 275–276; §§1, 3.2, 5, 8, Editorial Notes); *pratyavartan* defined as the outer conforming to the inner, *atma*'s mediative regulation and the discord caused by resisting it, and awakening as immersion of each faculty by the next inward one with restfulness at every level as comprehensive resolu-

tion and *abhyudaya* (p. 277; §§3.2, 3.3, 6.3, 8); the three statuses of *buddhi*'s development, sleep and dream as the union of *vritti* and *mun* alone, and ego as the basis of all activity until *atma-bodh* (pp. 278–279; §§4.1, 5.2, 6, 8); just behaviour and *dharma*-based thought making *buddhi* immersed, the signal-reception chain at each coupling, reflection from behaviour through thought, desire, and resolve to realisation, the *antarniyaman* of *jeevan*'s powers with *dhyān*, and the four absence-conditions for reflection (pp. 282–284; §§4, 6.3, 6.4, 6.5); *buddhi*'s reflection toward *atma* making *atma-bodh* and realisation in Omnipresence effective together, and visualisation without the enlightenment of truth necessarily carrying the flaws of excess, deficiency, or omission (p. 286; §§6.3, 6.5, 8, 11.2, Editorial Notes); the four values withheld until *buddhi*, *chitta*, *vritti*, and *mun* become completely affected by *atma* (p. 290; §6.3); capacity, ability, and receptivity determined by the *sanskar* of the sentient unit (p. 298; §4.1); the attainment of suitable capacity, ability, and receptivity as the pinnacle of a unit's awakening (p. 302; §4.1); the dominant faculty effects of the bodily propensities and *eshanas* (p. 305; §7.1); justice as recognising relationships, fulfilling values, evaluating, and achieving mutual satisfaction (p. 311; §11.2); the single immersion from realisation in Omnipresence named bliss, contentment, peace, and happiness at *buddhi*, *chitta*, *vritti*, and *mun*, the inward reflection sequence, and reflection as the cause of awakening (p. 307; §§3.1, 6.3, Editorial Notes); the six activities of the sentient aspect with their definitions, *susanskar* and *kusanskar*, and *sanskar* as culture and civilisation in the joint form (pp. 313–315; §§4.2, 6.1, 6.3, 6.4, Editorial Notes); *chintan* as the awareness of truth, resolved thought as its comprehension, and just behaviour as its perception (p. 316; §6.2, Editorial Notes); the levels of evaluation, with deluded humans holding the four instincts most valuable, discerning humans the three *eshanas*, and delusion-free humans liberation from delusion (p. 319; §11.2); the complete development of each faculty by accepting the signals of the one inward of it—*chitta* by capacity for creative visualisation, *vritti* by ability to generate thoughts of *dharma*, *mun* by receptivity for just behaviour—and the per-faculty counts totalling 122 activities in the form of strength and power, that is, state and motion (pp. 322–323; §§4, 4.1, 5, 6.2, 9, 11.2, Editorial Notes); *chayan* as choosing what is pleasing to *mun* in expectation of taste, the eight activities of visualisation in *chitta* as form, property, count, time, expanse, effort, motion, and result, and the concurrence ladder from just behaviour and vocation through to *atma* and Omnipresence (p. 327; §§3.1, 5.5, 9.2); the block headings of the detailed enumeration—two activities of *atma* as realisation and authenticity and four of *buddhi* in the form of enlightenment and resolve (p. 328), sixteen of *chitta* in the form of contemplation and visualisation (p. 329), thirty-six of *vritti* in the form of deliberation and analysis (p. 332), and sixty-four of *mun* in the form of selection and taste (p. 339) (§§5, 9); the definitions of the 122 activities in dyads, each naming its *bal* first and its *shakti* second, including *medha* as the carrier-bearer activity of memory (p. 330), justice given again as recognition of relationships, fulfilling of values, evaluation, and mutual satisfaction (p. 336), *samvedna* in *vritti* (p. 337), the five cognitive modalities named within the definition of *priya* (p. 343), the *guru* as one who establishes inquiries and questions as reso-

lution into conception (p. 344), and the sensory pairs of touch, temperature, the six tastes, smell, and visible form, with *samvahan* as bearability and *sanrakshan* as organ-level protection, among the activities of the cognitive and work organs (pp. 347–348) (pp. 328–348; §§6.4, 6.5, 7.1, 9, 9.1, 9.2, Editorial Notes).
